16-bit Microcontroller

CMOS

F²MC-16LX MB90800 Series

MB90803/803S/F803/F803S/F804-101/ MB90F804-201/F809/F809S/V800

■ DESCRIPTION

The MB90800 series is a general-purpose 16-bit microcontroller that has been developed for high-speed real-time processing required for industrial and office automation equipment and process control, etc. The LCD controller of 48 segment four common is built into.

Instruction set has taken over the same AT architecture as in the F²MC-8L and F²MC-16L, and is further enhanced to support high level languages, extend addressing mode, enhanced divide/multiply instructions with sign and enrichment of bit processing. In addition, long word processing is now available by introducing a 32-bit accumulator.

Note: F²MC is the abbreviation of Fujitsu Flexible Microcontroller.

■ FEATURES

• **Clock**
  • Built-in PLL clock frequency multiplication circuit
  • Operating clock (PLL clock) : divided-by-2 of oscillation (at oscillation of 6.25 MHz) or
                                    1 to 4 times the oscillation (at oscillation of 6.25 MHz to 25 MHz).
  • Minimum instruction execution time of 40.0 ns (at oscillation of 6.25 MHz, four times the PLL clock, operation at Vcc = 3.3 V)

• **The maximum memory space:16 Mbytes**
  • 24-bit internal addressing
  • Bank addressing

For the information for microcontroller supports, see the following web site.

http://edevice.fujitsu.com/micom/en-support/

FUJITSU

MB90800 Series

(Continued)

- **Optimized instruction set for controller applications**
  - Wide choice of data types (bit, byte, word, and long word)
  - Wide choice of addressing modes (23 types)
  - High code efficiency
  - Enhanced high-precision computing with 32-bit accumulator
  - Enhanced Multiply/Divide instructions with sign and the RETI instruction

- **Instruction system compatible with high-level language (C language) and multitask**
  - Employing system stack pointer
  - Instruction set has symmetry and barrel shift instructions

- **Program Patch Function (2 address pointer)**

- **4-byte instruction queue**

- **Interrupt function**
  - The priority level can be set to programmable.
  - Interrupt function with 32 factors

- **Data transfer function**
  - Expanded intelligent I/O service function (EI^{2}OS): Maximum of 16 channels

- **Low Power Consumption Mode**
  - Sleep mode (a mode that halts CPU operating clock)
  - Time-base timer mode (a mode that operates oscillation clock and time-base timer)
  - Watch mode (mode in which only the subclock and watch timers operate)
  - Stop mode (a mode that stops oscillation clock and sub clock)
  - CPU blocking mode (operating CPU at each set cycle)

- **Package**
  - QFP-100 (FPT-100P-M06 : 0.65 mm lead pitch)

- **Process : CMOS technology**

FUJITSU

■ PRODUCT LINEUP

| Part number Item	MB90V800-101/201	MB90F804-101/201	MB90803/MB90803S	MB90F803/MB90F803S	MB90F809/MB90F809S
Type	Evaluation product	Flash memory products	Mask ROM products	Flash memory products	
System clock	On-chip PLL clock multiplication method(× 1, × 2, × 3, × 4, 1/2 when PLL stops) Minimum instruction execution time of 40.0 ns (at oscillation of 6.25 MHz, four times the PLL clock)				
Sub clock	With sub clock: 201 option Without sub clock: 101 option		With sub clock: Part number of products without "S" suffix Without sub clock: Part number of products with "S" suffix		
ROM capacity	No	256 Kbytes	128 Kbytes	128 Kbytes dual operation	192 Kbytes
RAM capacity	28 Kbytes	16 Kbytes	4 Kbytes	4 Kbytes	10 Kbytes

CPU functions	Number of basic instructions : 351
	Minimum instruction execution time : 40.0 ns/6.25 MHz oscillator
	                                                    (When four times is used : machine clock
	                                                    25 MHz, Power supply voltage : 3.3 V ± 0.3 V)
	Addressing type : 23 types
	Program Patch Function : 2 address pointers
	The maximum memory space : 16 Mbytes				

Ports	I/O port (CMOS) 68 ports (shared with resources), (70 ports when the subclock is not used)				
LCD controller/driver	Segment driver that can drive the LCD panel (liquid crystal display) directly, and common driver 48 SEG × 4 COM				
16-bit input/output timer	16-bit free-run timer	1 channel Overflow interrupt			
	Output compare (OCU)	2 channels Pin input factor: matching of the compare register			
	Input capture (ICU)	2 channels Rewriting a register value upon a pin input (rising edge, falling edge, or both edges)			
16-bit Reload Timer	16-bit reload timer operation (toggle output, single shot output selectable) The event count function is optional. The event count function is optional. Three channels are built in.				
16-bit PPG timer	Output pin × 2 ports Operating clock frequency : fcp, fcp/22, fcp/24, fcp/26 Two channels are built in.				
Time-base timer	1 channel				
Watchdog timer	1 channel				
Timer clock output circuit	Clock with a frequency of external input clock divided by 16/32/64/128 can be output externally.				
I²C bus	I²C Interface. 1 channel is built-in.

■ PIN DESCRIPTION

Pin No.	Pin Name	I/O Circuit Type*	Status/function at reset	Function
92, 93	X1, X0	A	Oscillation status	It is a terminal which connects the oscillator. When connecting an external clock, leave the x1 pin unconnected.
13, 14	X0A, X1A	B	Oscillation status	It is 32 kHz oscillation pin. (Dual-line model)
	P90, P91	G	Port input (High-Z)	General purpose input/output port. (Single-line model)
51	MD2	M	Mode Pins	Input pin for selecting operation mode. Connect directly to Vss.
52, 53	MD1, MD0	L	Mode Pins	Input pin for selecting operation mode. Connect directly to Vcc.
54	RST	K	Reset input	External reset input pin.
63, 64, 67 to 76	SEG0 to SEG11	D	LCD SEG output	A segment output terminal of the LCD controller/driver.
77 to 84	SEG12 to SEG19	E	Port input (High-Z)	A segment output terminal of the LCD controller/driver.
	P00 to P07			General purpose input/output port.
85 to 89, 94 to 96	SEG20 to SEG27	E		A segment output terminal of the LCD controller/driver.
	P10 to P17			General purpose input/output port.
97 to 100, 1 to 4	SEG28 to SEG35	E		A segment output terminal of the LCD controller/driver.
	P20 to P27			General purpose input/output port.
5	SEG36	E		A segment output terminal of the LCD controller/driver.
	P30			General purpose input/output port.
	SO3			Serial data output pin of serial I/O ch.3. Valid when serial data output of serial I/O ch.3 is enabled.
6	SEG37	E		A segment output terminal of the LCD controller/driver.
	P31			General purpose input/output port.
	SC3			Serial clock I/O pin of serial I/O ch.3. Valid when serial clock output of serial I/O ch.3 is enabled.

FUJITSU

Pin No.	Pin Name	I/O Circuit Type*	Status/function at reset	Function
7	SEG38	E	Port input (High-Z)	A segment output terminal of the LCD controller/driver.
	P32			General purpose input/output port.
	SI3			Serial data input pin of serial I/O ch.3. This pin may be used during serial I/O ch.3 in input mode, so it cannot use as other pin function.
8	SEG39	E		A segment output terminal of the LCD controller/driver.
	P33			General purpose input/output port.
	TMCK			Timer clock output pin. It is effective when permitting the power output.
9, 10	SEG40, SEG41	E		A segment output terminal of the LCD controller/driver.
	P34, P35			General purpose input/output port.
	IC0, IC1			External trigger input pin of input capture ch.0/ch.1.
11, 12	SEG42, SEG43	E		A segment output terminal of the LCD controller/driver.
	P36, P37			General purpose input/output port.
	OCU0, OCU1			Output terminal for the output compares ch.0/ch.1.
17 to 21	LED0 to LED4	F		It is a output terminal for LED (I_{OL} = 15 mA).
	P40 to P44			General purpose input/output port.
22 to 24	LED5 to LED7	F		It is a output terminal for LED (I_{OL} = 15 mA).
	P45 to P47			General purpose input/output port.
	TOT0 to TOT2			External event output pin of reload timer ch.0 to ch.2. It is effective when permitting the external event output.
25, 26	SEG44, SEG45	E		A segment output terminal of the LCD controller/driver.
	P50, P51			General purpose input/output port.
	TIN0, TIN1			External clock input pin of reload timer ch.0, ch.1. It is effective when permitting the external clock input.

(Continued)

Pin No.	Pin Name	I/O Circuit Type*	Status/function at reset	Function
27	SEG46	E	Port input (High-Z)	A segment output terminal of the LCD controller/driver.
	P52			General purpose input/output port.
	TIN2			External clock input pin of reload timer ch.2. It is effective when permitting the external clock input.
	PPG0			PPG timer (ch.0) output pin.
28	SEG47	E		A segment output terminal of the LCD controller/driver.
	P53			General purpose input/output port.
	PPG1			PPG (ch.1) timer output pin.
29	SIO	G		Serial data input pin of UART ch.0. This pin may be used during UART ch.0 in receiving mode, so it cannot use as other pin function.
	P54			General purpose input/output port.
30	SC0	G		Serial clock input/output pin of UART ch.0. It is effective when permitting the serial clock output of UART ch.0.
	P55			General purpose input/output port.
31	SO0	G		Serial data output pin of UART ch.0. It is effective when permitting the serial clock output of UART ch.0.
	P56			General purpose input/output port.
33	SI1	G		Serial data input pin of UART ch.1. This pin may be used during UART ch.1 in receiving mode, so it cannot use as other pin function.
	P57			General purpose input/output port.
34	P76	G		General purpose input/output port.
36 to 40	AN0 to AN4	I		Analog input pin ch.0 to ch.4 of A/D converter. Enabled when analog input setting is "enabled"(set by ADER).
	P60 to P64			General purpose input/output port.

(Continued)

Pin No.	Pin Name	I/O Circuit Type*	Status/function at reset	Function
41 to 43	AN5 to AN7	I	Analog input (High-Z)	Analog input pin ch.5 to ch.7 of A/D converter. Enabled when analog input setting is "enabled".
	P65 to P67			General purpose input/output port.
	INT0 to INT2			Functions as an external interrupt ch.0 to ch.2 input pin.
45	AN8	I		Analog input pin ch.8 of A/D converter. Enabled when analog input setting is "enabled".
	P70			General purpose input/output port.
	INT3			Functions as an external interrupt ch.3 input pin.
46	AN9	I	Port input (High-Z)	Analog input pin ch.9 of A/D converter. Enabled when analog input setting is "enabled".
	P71			General purpose input/output port.
	SC1			Serial clock input/output pin of UART ch.1. It is effective when permitting the serial clock output of UART ch.1.
47	AN10	I		Analog input pin ch.10 of A/D converter. Enabled when analog input setting is "enabled".
	P72			General purpose input/output port.
	SO1			Serial data output pin of serial I/O ch.1. Valid when serial data output of serial I/O ch.1 is enabled.
48	AN11	I		Analog input pin ch.11 of A/D converter. Enabled when analog input setting is "enabled".
	P73			General purpose input/output port.
	SI2			Serial data input pin of serial I/O ch.2. This pin may be used during serial I/O ch.2 in input mode, so it cannot use as other pin function.

(Continued)

(Continued)

Pin No.	Pin Name	I/O Circuit Type*	Status/function at reset	Function
49	SDA	H	Port input (High-Z)	Data input/output pin of I²C Interface. This pin is enabled when the I²C interface is operated. While the I²C interface is running, the port must be set for input use.
	P74			General purpose input/output port. (N-ch open-drain, withstand voltage of 5 V.)
	SC2			Serial clock input pin of serial I/O ch.2. Valid when serial clock output of serial I/O ch.2 is enabled.
50	SCL	H		Clock input/output pin of I²C Interface. This pin is enabled when the I²C interface is operated. While the I²C interface is running, the port must be set for input use.
	P75			General purpose input/output port. (N-ch open-drain, withstand voltage of 5 V.)
	SO2			Serial data output pin of serial I/O ch.2. Valid when serial data output of serial I/O ch.2 is enabled.
55 to 57	V0 to V2	J	LCD drive power supply input	LCD controller/driver. Reference power terminals of LCD controller/driver.
	P80 to P82			General purpose input/output port.
59, 60	COM0, COM1	D	LCD COM output	A common output terminal of the LCD controller/driver.
61, 62	P83, P84	E	Port input (High-Z)	General purpose input/output port.
	COM2, COM3			A common output terminal of the LCD controller/driver.
32	AVcc	C	Power supply	A/D converter exclusive power supply input pin.
35	AVss	C		A/D converter-exclusive GND power supply pin.
58	V3	J		LCD controller/driver Reference power terminals of LCD controller/driver.
15, 65, 90	Vcc	—		These are power supply input pins.
16, 44, 66, 91	Vss	—		GND power supply pin.
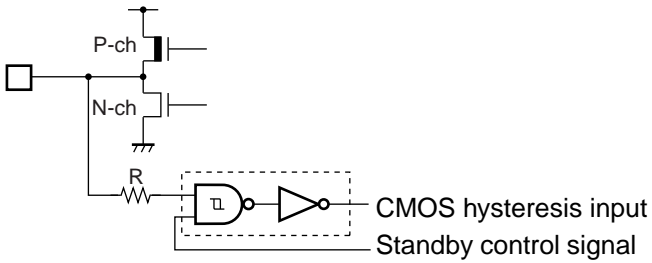

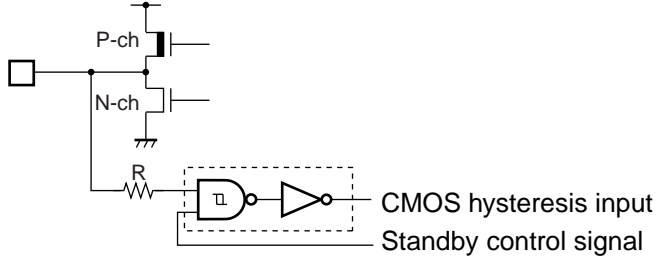

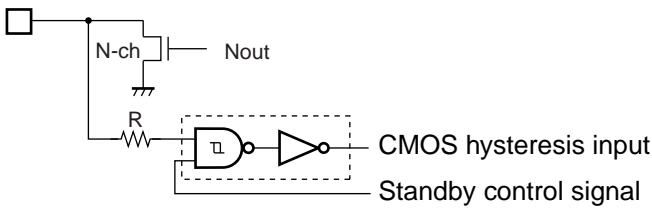

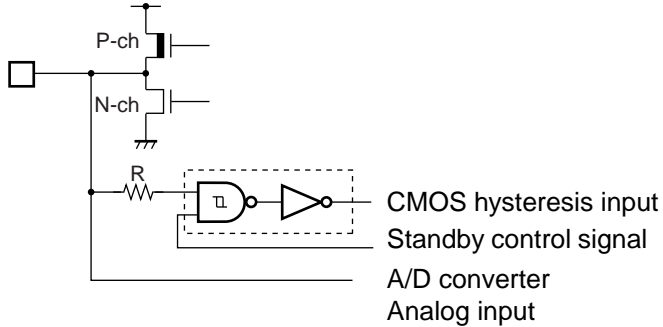

* : Refer to "■ I/O CIRCUIT TYPE" for details on the I/O circuit types.

FUJITSU

■ I/O CIRCUIT TYPE

Type	Circuit	Remarks
A	X1 P-ch N-ch X0 Clock input Standby control signal	Oscillation feedback resistance : 1 MΩ approx.
B	X1A P-ch N-ch X0A Clock input Standby control signal	Low-rate oscillation feedback resistor, approx.10 MΩ
C	P-ch N-ch AVP	Analog power supply input protection circuit
D	P-ch N-ch R LCDC output	LCDC output
E	P-ch N-ch R R LCDC output CMOS hysteresis input Standby control signal	• CMOS output • LCDC output • CMOS hysteresis input (With input interception function at standby)

(Continued)
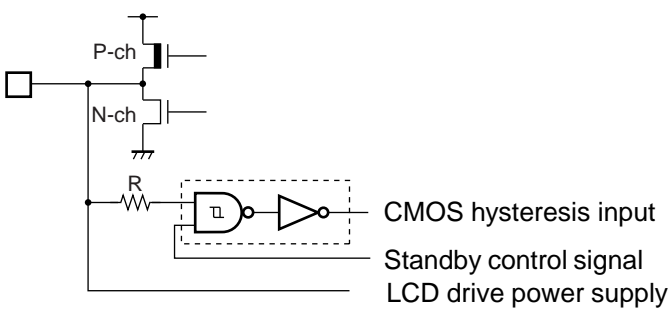

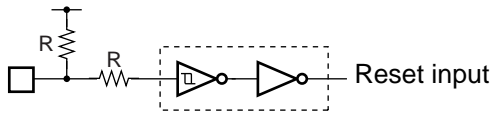

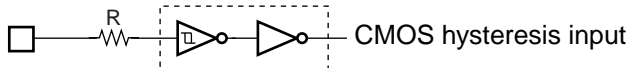

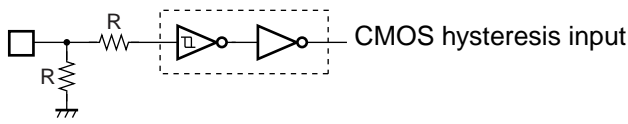

Type	Circuit	Remarks
F	P-ch N-ch R CMOS hysteresis input Standby control signal	• CMOS output (Heavy-current I_{OL} =15 mA for LED drive) • CMOS hysteresis input (With input interception function at standby)
G	P-ch N-ch R CMOS hysteresis input Standby control signal	• CMOS output • CMOS hysteresis input (With input interception function at standby) Notes : • The I/O port and internal resources share one output buffer for their outputs. • The I/O port and internal resources share one input buffer for their input.
H	N-ch Nout R CMOS hysteresis input Standby control signal	• CMOS hysteresis input (With input interception function at standby) • N-ch open drain output
I	P-ch N-ch R CMOS hysteresis input Standby control signal A/D converter Analog input	• CMOS output • CMOS hysteresis input (With input interception function at standby) • Analog input (If the bit of analog input enable register $= 1$, the analog input of A/D converter is enabled.) Notes : • The I/O port and internal resources share one output buffer for their outputs. • The I/O port and internal resources share one input buffer for their inputs.

MB90800 Series

■ **HANDLING DEVICES**

1. Preventing Latch-up, Turning on Power Supply

Latch-up may occur on CMOS IC under the following conditions:

• If a voltage higher than V_{CC} or lower than V_{SS} is applied to input and output pins,

• A voltage higher than the rated voltage is applied between V_{CC} pin and V_{SS} pin.

• If the AV_{CC} power supply is turned on before the V_{CC} voltage.

Ensure that you apply a voltage to the analog power supply at the same time as V_{CC} or after you turn on the digital power supply (when you perform power-off, turn off the analog power supply first or at the same time as V_{CC} and the digital power supply).

When latch-up occurs, power supply current increases rapidly and might thermally damage elements. When using CMOS IC, take great care to prevent the occurrence of latch-up.

2. Treatment of unused pins

If unused input pins are left open, they may cause abnormal operation or latch-up which may lead to permanent damage to the semiconductor. Any such pins should be pulled up or pulled down through resistance of at least 2 kΩ.

Any unused input/output pins should be left open in output status, or if found set to input status, they should be treated in the same way as input pins.

Any unused output pins should be left open.

## 3. Treatment of A/D converter power supply pins

Even if the A/D converter is not used, pins should be connected so that $AV_{CC} = V_{CC}$, and $AV_{SS} = V_{SS}$.

4. About the attention when the external clock is used

In using an external clock, drive pin X0 only and leave pin X1 open.
The example of using an external clock is shown below.
Please set X0A = GND and X1A = open without subclock mode.
The following figure shows the using sample.

FUJITSU
5. Treatment of power supply pins (Vcc/Vss)

In products with multiple Vcc or Vss pins, the pins of the same potential are internally connected in the device to avoid abnormal operations including latch-up. However, you must connect all power supply pins to external power supply and a ground line to lower the electro-magnetic emission level, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with the Vcc and Vss pins of this device at the low impedance.

It is also advisable to connect a ceramic capacitor of approximately 0.1 μF as a bypass capacitor between Vcc and Vss near this device.

6. About Crystal oscillators circuit

Noise near the X0/X1 pins and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1 pins and X0A/X1A pins, the crystal oscillator (or the ceramic oscillator) and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended to design the PC board artwork with the X0/X1 pins and X0A/X1A pins surrounded by ground plane because stable operation can be expected with such a layout.

Please ask the crystal maker to evaluate the oscillational characteristics of the crystal and this device.

7. Caution on Operations during PLL Clock Mode

On this microcontroller, if in case the crystal oscillator breaks off or an external reference clock input stops while the PLL clock mode is selected, a self-oscillator circuit contained in the PLL may continue its operation at its self-running frequency. However, Fujitsu will not guarantee results of operations if such failure occurs.

8. Stabilization of Supply Power Supply

A sudden change in the supply voltage may cause the device to malfunction even within the Vcc supply voltage operating range.Therefore, the Vcc supply voltage should be stabilized. For reference, the supply voltage should be controlled so that Vcc ripple variations (peak- to-peak values) at commercial frequencies (50 Hz/60 Hz) fall below 10% of the standard Vcc supply voltage and the coefficient of fluctuation does not exceed 0.1 V/ms at instantaneous power switching.

9. Note on Using the two-subsystem product as one-subsystem product
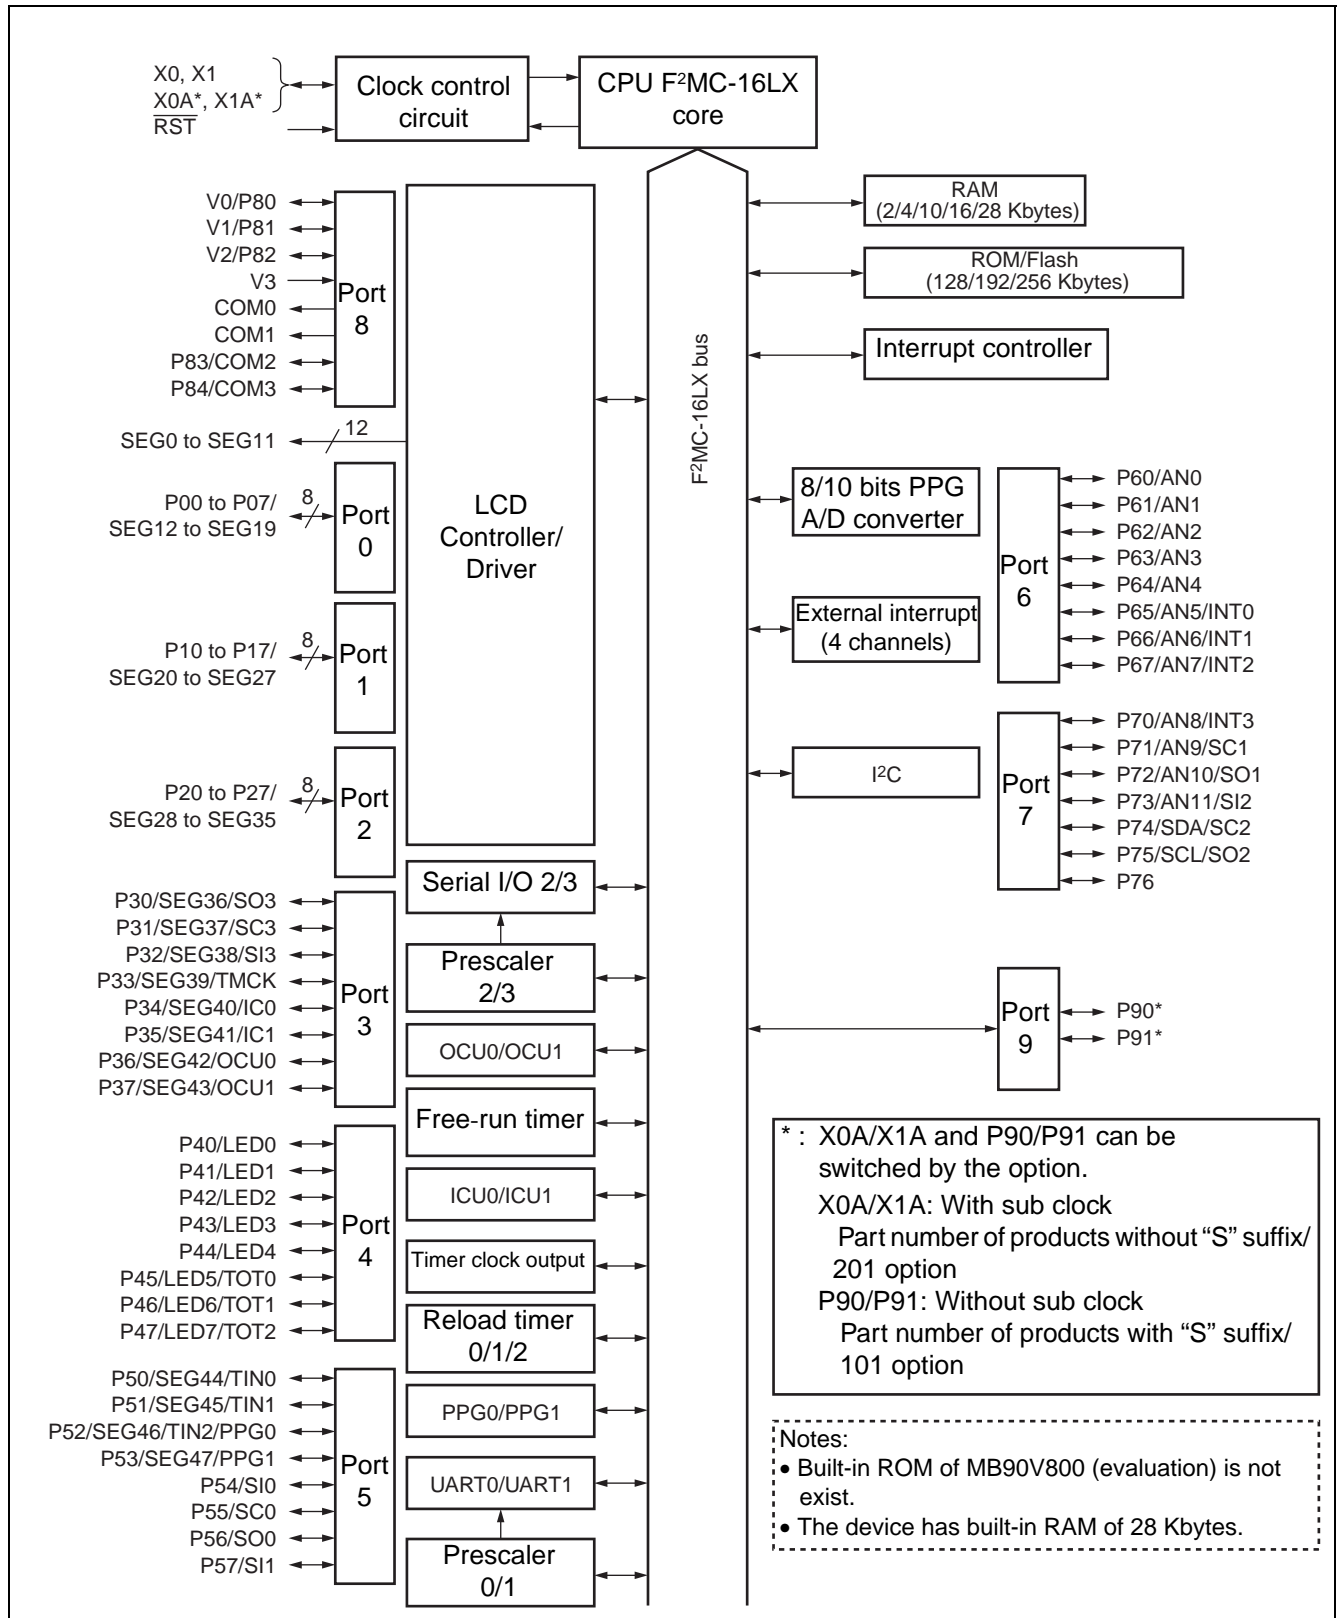

If you are using only one subsystem of the MB90800 series that come in one two-subsystem product, use it with X0A = Vss and X1A = OPEN.
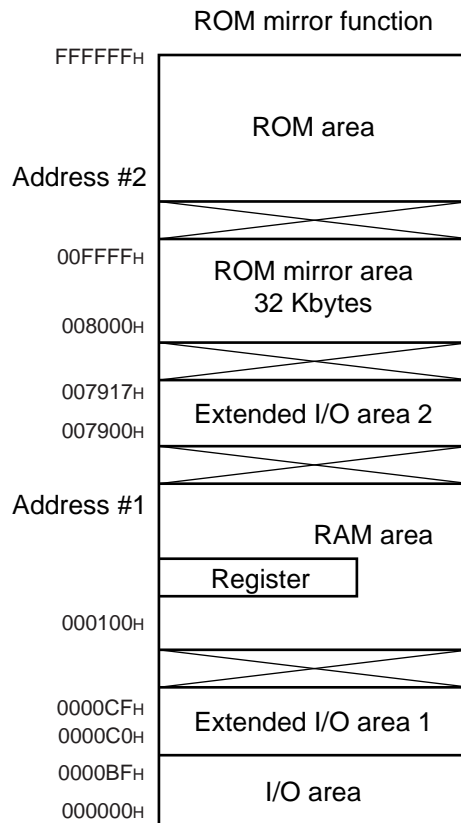

10. Write to FLASH

Ensure that you must write to FLASH at the operating voltage Vcc = 3.0 V to 3.6 V.

    F80000H is ROM decipherment region on the tool side.

Memory Map of MB90800 Series

Notes :
- When the ROM mirror function register has been set, the mirror image data at higher addresses ("FF4000H to FFFFFFH") of bank FF is visible from the higher addresses ("008000H to 00FFFFH") of bank 00.
- The ROM mirror function is for using the C compiler small model.
- The lower 16-bit addresses of bank FF are equivalent to those of bank 00. Note that because the ROM area of bank FF exceeds.
  32 Kbytes, all data in the ROM area cannot be shown in mirror image in bank 00.
- When the C compiler small model is used, the data table can be shown as mirror image at "008000H to 00FFFFH "by storing the data table at "FF8000H to FFFFFFH". Therefore, data tables in the ROM area can be referenced without declaring the far addressing with the pointer.

○ : Available

× : Unavailable

◎ : Available EI²OS function is provided.

△ : Available when a cause of interrupt sharing a same ICR is not used.

* : When interrupts of the same level are output at the same time, the interrupt with the smallest interrupt vector number has the priority.

- For a resource that has two interrupt causes in the same interrupt control register (ICR), use of EI²OS is enabled, EI²OS is started upon detection of one of the interrupt causes. As interrupts other than the start cause are masked during EI²OS start, masking one of the interrupt causes is recommended when using EI²OS.
- For a resource that has two interrupt causes in the same interrupt control register (ICR), the interrupt flag is cleared by an EI²OS interrupt clear signal.

FUJITSU

■ PERIPHERAL RESOURCES

1. I/O port

The I/O ports function to output data from the CPU to I/O pins by setting their port data register (PDR) and send signals input to I/O pins to the CPU. In addition, the port can randomly set the direction of the input/output of the port in bit by the port direction register (DDR).

The MB90800 series has 68 (70 ports when the subclock is not used) input/output pins. Port0 to port8 (port0 to port9 when product without the subclock is used) are input/output port.

- : Unused

* : R/W access to I/O ports is a bit different in behavior from R/W access to memory as follows
  - Input mode
    - When reading : Read the corresponding pin level.
    - When writing : Write into the latch for the output.
  - Output mode
    - When reading : Read the value of the data register latch.
    - When writing : Write into the corresponding pin.

- : Unused

When each terminal functions as a port, each correspondent pin are controlled by the port direction register to following;
0 : Input mode
1 : Output mode   This bit becomes "0" after a reset.

Note : When accessing this register by using the instruction of the read modify write system (instructions such as bit set) is mode, the bit targeted by an instruction becomes the defined value. However, the content of the output register set to input with the other changes to input value of the pin at that time. Therefore, be sure to write an expected value into PDR firstly, and then set DDR and finally change to the output when changing the input pin to the output pin is made.

(3) Analog Input Enable register

ADER0   bit

Address : 00001E$_H$

7	6	5	4	3	2	1	0
ADE7	ADE6	ADE5	ADE4	ADE3	ADE2	ADE1	ADE0

Initial Value: 11111111$_B$ Access: R/W

ADER1   bit

Address : 00001F$_H$

15	14	13	12	11	10	9	8
—	—	—	—	ADE11	ADE10	ADE9	ADE8

Initial Value: - - - -1111$_B$ Access: R/W

- : Unused

Each pin of port 6 is controlled by the analog input enable register as follow.

    0 : Port input/output mode.

    1 : Analog input mode.This bit becomes "1" after a reset.

2. UART

UART is a serial I/O port for asynchronous (start-stop synchronization) communication or CLK synchronous communications.
- With full-duplex double buffer
- Clock asynchronous (start-stop synchronization) , CLK synchronous communications (no start-bit/stop-bit) can be used.
- Supports multi-processor mode
- Built-in dedicated baud rate generator

  Asynchronous   : 120192/60096/30048/15024/781.25 K/390.625 kbps
  CLK synchronous : 25 M/12.5 M/6.25 M/3.125 M/1.5627 M/781.25 kbps
- Variable baud rate can be set by an external clock.
- 7 bits data length (only asynchronous normal mode) /8 bits length
- Master/slave type communication function (at multiprocessor mode) : The communication between one (master) to n (slave) can be operating.
- Error detection functions(parity, framing, overrun)
- Transmission signal format is NRZ

3. I²C Interface

I²C interface is the serial input/output port that support Inter IC BUS and functions as the master/slave device on the I²C bus. MB90800 series have 1 channel of the built-in I²C interface.

It has the features of I²C interface below.
- Master/slave sending and receiving
- Arbitration function
- Clock synchronization function
- Slave address and general call address detection function
- Detecting transmitting direction function
- Repeat generating and detecting function of the start conditions
- Bus error detection function
- The forwarding rate can be supported to 100 kbps.

4. Extended I/O serial interface

The extended I/O serial interface is a serial I/O interface that can transfer data through the adoption of 8-bit × 2 channels configured clock synchronization scheme. The extended I/O serial interface also has two alternatives in data transfer called LSB first and MSB first.

The serial I/O interface operates in two modes:
- Internal shift clock mode : Transfer data in sync with the internal clock.
- External shift clock mode : Transfers data in sync with the clock input through an external pin (SC) . In this mode, transfer operation performed by the CPU instruction is also available by operating the general-use port sharing an external pin (SC) .

5. 8/10-bit A/D converter

The feature of 8/10-bit A/D converter is shown as follows.
• conversion time : 3.1 μs minimum per 1 channel

(78 machine cycle/at machine clock 25 MHz/including the sampling time)
• Sampling time : 2.0 μs minimum per 1channel

(50 machine cycle/at machine clock 25 MHz)
• Uses RC-type successive approximation conversion method with a sample & hold circuit
• 8-bit resolution or 10-bit resolution can be select.
• 12 channel program-selectable analog inputs.

Single conversion mode	: Convert specified 1 channel
Scan conversion mode	: Continuous plural channels (maximum 12 channels can be programmed) are converted.
Continuous conversion mode	: Selected channel converted continuously.
Stop conversion time	: Perform conversion for one channel, then pause it to wait for the next activation trigger (synchronizes the conversion start timing)

• EI^{2}OS can be activated by outputting the interrupt request when the A/D conversion completes.
• If the A/D conversion is performed under the condition of the interrupt enable, the converting data will be protected.
• Selectable conversion activation trigger : Software, or reload timer (rising edge)

6. 16 bits PPG

The PPG timer consists of the following:
• Prescaler
• 16-bit down-counter: 1
• 16-bit data register with a cycle setting buffer
• 16-bit compare register with a duty setting buffer
• Pin control unit

The PPG timer can output pulses synchronized to the software trigger.

The output pulse can be changed to any cycle and duty freely by updating the PCSRL, PCSRH/PDUTL, PDUTH registers.

• PWM function

The PPG timer can output pulses programmably by updating the PCSR and PDUT registers described above in synchronization to the trigger.

Can also be used as a D/A converter by an external circuit.

• Single shot function

By detecting an edge of the trigger input, a single pulse can be output.

• 16-bit down counter

The counter operation clock comes from eight kinds optional. There are eight kinds of internal clocks.

(ϕ, $\phi2$, $\phi4$, $\phi8$, $\phi16$, $\phi32$, $\phi64$, $\phi128$) ϕ : machine clock

The counter can be initialized to "FFFF$_H$" at a reset or counter borrow.

• Interrupt request

The PPG timer generates an interrupt request when :
• Timer start-up
• Counter borrow occurrence (cycle match)
• Duty match occurrence

• Block diagram
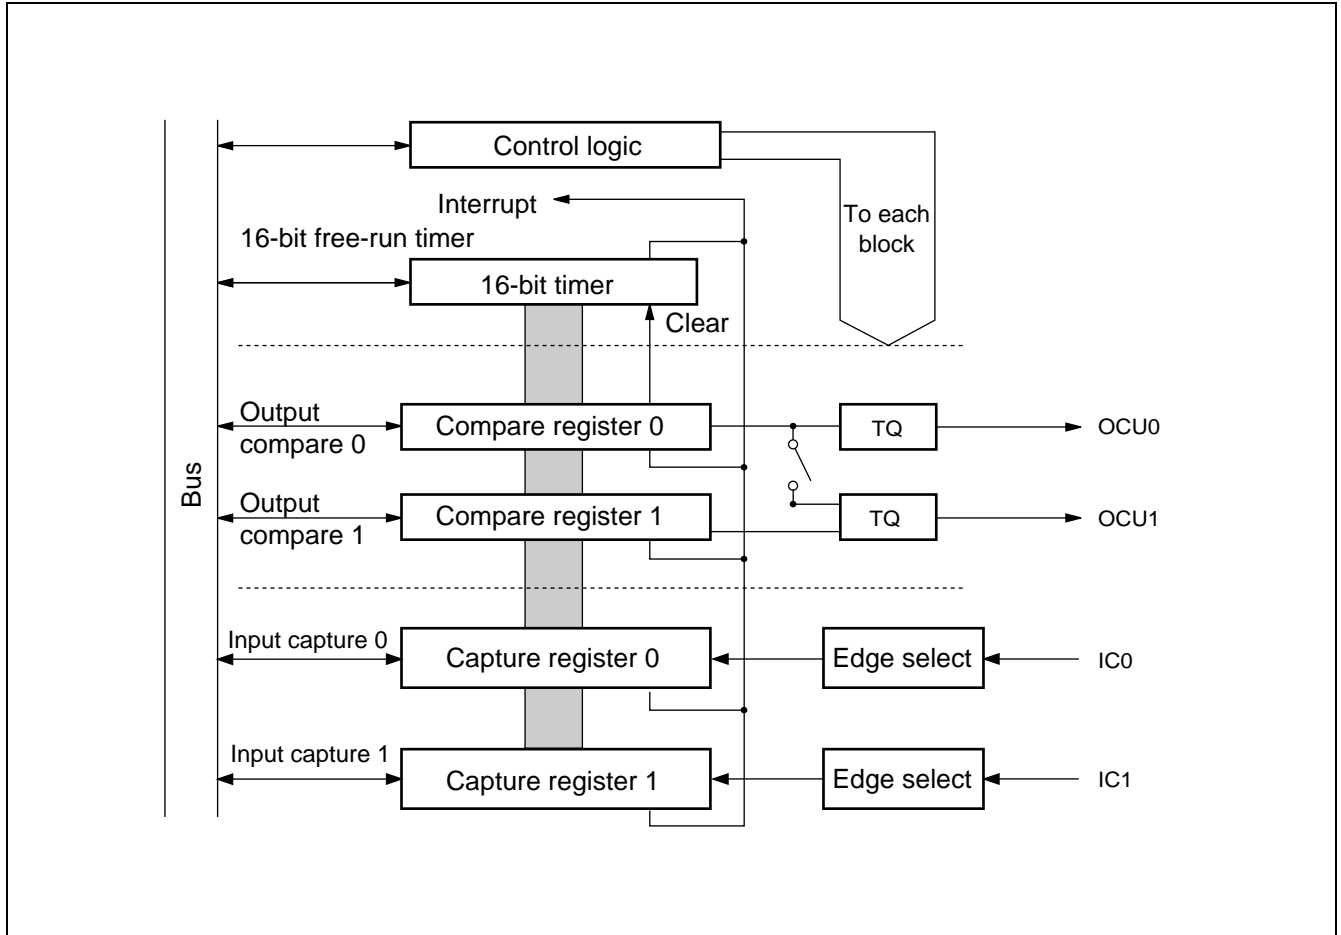

(1) 16-bit free-run timer

The 16-bit free-run timer consists of a 16-bit up-down counter and control status register.

Counter value of 16-bit free-run timer is available as base timer for input capture and output compare.
• Clock for the counter operation can be selected from eight types.
• The counter overflow interruption can be generated.
• Setting the mode enables initialization of the counter through compare-match operation with the value of the compare clear register in the output compare and that of the free-run timer counter.

(3) Input capture

The input capture consists of input capture and control registers. Each input capture has its corresponding external input pin.

This module has a function that detects a rising edge, falling edge or both edges and holds a value of the 16-bit free-run timer in a register at the time of detection. It can also generate an interrupt when detecting an edge.
- The detection edge of an external input can be selected from among three types. Rising edge/falling edge/ both edges.
- It can generate an interrupt when it detects the valid edge of the external input.

10. 16-bit reload timer

The 16-bit reload timer provides two functions either one which can be selected, the internal clock mode that performs the count down by synchronizing with 3-type internal clocks and the event count mode that performs the count down by detecting the arbitration. This timer defines an underflow as a transition of the count value from 0000_H to $FFFF_H$. Therefore, when the equation (counted value = reload register setting value+1) holds, an underflow occurs. Either mode can be selected for the count operation from the reload mode which repeats the count by reloading the count setting value at the underflow occurrence or the one-shot mode which stops the count at the underflow occurrence. The interrupt can be generated at the counter underflow occurrence so as to correspond to the DTC.

14. Clock generator

The clock generator controls operation of the internal clock which is the operation clock for the CPU and peripheral devices. This internal clock is used as machine clock and its one cycle as machine cycle. In addition, the clock generated by original oscillation is used as oscillation clock and that by internal PLL oscillation as PLL clock.

16. Timer clock output

The timer clock output circuit divides the oscillation clock by the time-base timer and generates and outputs the set division clock. Selectable from 32/64/128/256 division of the oscillation clock.

The timer clock output circuit is inactive in reset or stop mode. It is active in normal run, sleep, or pseudo-timer mode.

	PLL_Run	Main_Run	Sleep	Pseudo clock	STOP	Reset
Operation status	○	○	○	○	×	×

Note : When the time-base timer is cleared while using the timer clock output circuit, the clock is not correctly output. For detail of the time-base timer's clear condition, see the section of time-base timer in the MB90800 Hardware Manual.

"H" level average total output current	ΣI_{OHAV}	—	− 60	mA	*7
Power consumption	Pd	—	351	mW	
Operating temperature	T_A	− 40	+ 85	°C	
Storage temperature	T_{STG}	− 55	+ 150	°C	

*1 : The parameter is based on $V_{SS} = AV_{SS} = 0.0$ V.

*2 : AV_{CC} should not be exceeding V_{CC} at power-on etc.

*3 : V_I, V_O, should not exceed $V_{CC} + 0.3$ V.

*4 : Applicable to pins : P74, P75

*5 : A peak value of an applicable one pin is specified as a maximum output current.

*6 : An average current value of an applicable one pin within 100 ms is specified as an average output current.
    (Average value is found by multiplying operating current by operating rate.)

*7 : An average current value of all pins within 100 ms is specified as an average total output current.
    (Average value is found by multiplying operating current by operating rate.)

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

FUJITSU

2. Recommended Operating Conditions

$(V_{SS} = AV_{SS} = 0.0\text{ V})$

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Power supply voltage	V_{CC}	2.7	3.6	V	At normal operating
		1.8	3.6	V	Stop operation state maintenance
"H" level input voltage	V_{IH}	$0.7\ V_{CC}$	$V_{CC} + 0.3$	V	CMOS input pin
	V_{IHS}	$0.8\ V_{CC}$	$V_{CC} + 0.3$	V	CMOS hysteresis input pin (Resisting pressure of 5 V is $V_{CC} = 5.0$ V)
	V_{IHM}	$V_{CC} - 0.3$	$V_{CC} + 0.3$	V	MD pin input
"L" level input voltage	V_{IL}	$V_{SS} - 0.3$	$0.3\ V_{CC}$	V	CMOS input pin
	V_{ILS}	$V_{SS} - 0.3$	$0.2\ V_{CC}$	V	CMOS hysteresis input pin
	V_{ILM}	$V_{SS} - 0.3$	$V_{SS} + 0.3$	V	MD pin input
Operating temperature	T_A	$- 40$	$+ 85$	°C	

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.
3. DC Characteristics

$(V_{CC} = AV_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}, V_{SS} = AV_{SS} = 0.0 \text{ V}, T_A = -40 \text{ °C to } + 85 \text{ °C})$

(3) Power-on reset

$(V_{CC} = AV_{CC} = 3.3\ V \pm 0.3\ V,\ V_{SS} = AV_{SS} = 0.0\ V,\ T_A = -40\ °C\ to + 85\ °C)$

Parameter	Symbol	Pin name	Condi-tions	Value		Unit	Remarks
				Min	Max		
Power supply rising time	t_R	V_{CC}	—	—	30	ms	At normal operating
Power supply shutdown time	t_{OFF}	V_{CC}		1	—	ms	Wait time until power on

Notes :
- V_{CC} should be set under 0.2 V before power-on rising up.
- These value are for power-on reset.
- In the device, there are internal registers which is initialized only by a power-on reset. If these initialization is executing, power-on procedure must be obeyed by these value.
Note : Sudden change of power supply voltage may activate the power-on reset function. When changing power supply voltages during operation, raise the power smoothly by suppressing variation of voltages as shown below.

FUJITSU
(4) Serial I/O

$(V_{CC} = AV_{CC} = 3.3\ V \pm 0.3\ V, V_{SS} = AV_{SS} = 0.0\ V, T_A = -40\ °C\ to\ +85\ °C)$

Parameter	Symbol	Pin name	Conditions	Value Min	Value Max	Unit
Serial clock cycle time	t_{SCYC}	SC0 to SC3	Internal shift clock mode output pin : $C_L = 80\ pF + 1TTL$	8 t_{CP}	—	ns
SCK ↓ → SOT delay time	t_{SLOV}	SC0 to SC3, SO0 to SO3		−80	+ 80	ns
Valid SIN → SCK ↑	t_{IVSH}	SC0 to SC3, SI0 to SI3		100	—	ns
SCK ↑ → Valid SIN hold time	t_{SHIX}			60	—	ns
Serial clock "H" pulse width	t_{SHSL}	SC0 to SC3	External shift clock mode output pin : $C_L = 80\ pF + 1TTL$	4 t_{CP}	—	ns
Serial clock "L" pulse width	t_{SLSH}			4 t_{CP}	—	ns
SCK ↓ → SOT delay time	t_{SLOV}	SC0 to SC3, SO0 to SO3		—	150	ns
Valid SIN → SCK ↑	t_{IVSH}	SC0 to SC3, SI0 to SI3		60	—	ns
SCK ↑ → valid SIN hold time	t_{SHIX}			60	—	ns

Notes : • The above rating is in CLK synchronous mode.
 • C_L is a load capacitance value on pins for testing.
 • t_{CP} is machine cycle frequency (ns) . Refer to " (1) Clock timing".

DS07-13733-6E
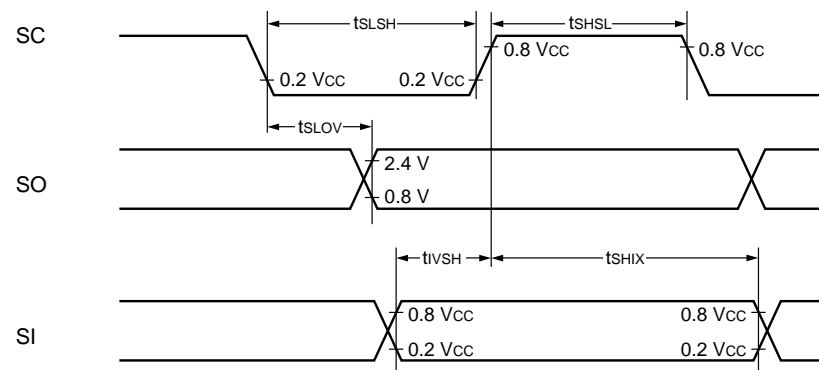

(5) Timer input timing

$(V_{CC} = AV_{CC} = 3.3\ V \pm 0.3\ V,\ V_{SS} = AV_{SS} = 0.0\ V,\ T_A = -40\ °C\ to +85\ °C)$

*1 : At operating, main clock 25 MHz.

*2 : If A/D converter is not operating, a current when CPU is stopped is applicable (at Vcc – CPU = AVcc = 3.3 V)

(2) Notes on Using A/D Converter

• About the external impedance of analog input and its sampling time

A/D converter with sample & hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion precision. Therefore, to satisfy the A/D conversion precision standard, consider the relation-ship between the external impedance and minimum sampling time and either adjust the resistor value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. And, if the sampling time cannot be sufficient, connect a capacitor of about 0.1 μF to the analog input pin.

• Analog input circuit model
	R	C
MB90803 (S)	1.9 kΩ (Max)	32.3 pF (Max)
MB90F804-201(101)/F803(S)/F809(S)	1.9 kΩ (Max)	25.0 pF (Max)
MB90V800	1.9 kΩ (Max)	32.3 pF (Max)

Note : The values are reference values.

• The relationship between external impedance and minimum sampling time

(External impedance = 0 kΩ to 100 kΩ)   (External impedance = 0 kΩ to 20 kΩ)
• About errors

As | AV$_{CC}$ – AV$_{SS}$ | becomes smaller, values of relative errors grow larger.

FUJITSU

6. Definition of A/D Converter Terms

Resolution

Analog variation that is recognized by an A/D converter.

The 10-bit can resolve analog voltage into $2^{10} = 1024$.

Total error

This shows the difference between the actual voltage and the ideal value and means a total of error because of offset error, gain error, non-linearity error and noise.

Linearity error

Deviation between a line across zero-transition line (00 0000 0000↔00 0000 0001) and full-scale transition line (11 1111 1110↔11 1111 1111) and actual conversion characteristics.

Differential linear error

Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.
Total error

$$\text{Total error of digital output N} = \frac{V_{NT} - \{1\,\text{LSB} \times (N-1) + 0.5\,\text{LSB}\}}{1\,\text{LSB}} \;[\text{LSB}]$$

$$1\text{LSB(Ideal value)} = \frac{AV_{CC} - AV_{SS}}{1024} \;[\text{V}]$$

N : A/D converter digital output value

V_{OT}(Ideal value) = AV_{SS} + 0.5 LSB [V]

V_{FST}(Ideal value) = AV_{CC} − 1.5 LSB [V]

V_{NT}: A voltage at which digital output transitions from $(N-1)_H$ to N_H.

(Continued)

(Continued)
$$\text{Linear error in digital output N} = \frac{V_{NT} - \{1\,LSB \times (N-1) + V_{OT}\}}{1\,LSB} \quad [LSB]$$

$$\text{Differential linear error in digital output N} = \frac{V_{(N+1)T} - V_{NT}}{1\,LSB} - 1LSB \quad [LSB]$$

$$1\,LSB = \frac{V_{FST} - V_{OT}}{1022} \quad [V]$$

N : A/D converter digital output value

V_{OT} : Voltage at which digital output transits from 000_H to 001_H.

V_{FST} : Voltage at which digital output transits from $3FE_H$ to $3FF_H$.

FUJITSU

7. Flash Memory (MB90F804-101/201, MB90F809/S)

Parameter	Conditions	Value			Unit	Remarks
		Min	Typ	Max
