1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Input Voltage 6.5V

Power Dissipation ..... Internally Limited (**Note 7**)

Maximum Voltage On Any Pin .....V_{IN} + 0.3V to -0.3V

† Notice: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

PIN FUNCTION TABLE

Name	Function
$\overline{SHDN}$	Shutdown control input.
NC	No connect
GND	Ground terminal
V_{OUT}	Regulated voltage output
V_{IN}	Unregulated supply input

ELECTRICAL CHARACTERISTICS

Electrical Specifications: Unless otherwise noted, $V_{IN} = V_R + 1V$, I_L = 100 µA, C_L = 1.0 µF, $\overline{SHDN} > V_{IH}$, T_A = +25°C
Boldface type specifications apply for junction temperatures of –40°C to +125°C.

Parameter	Sym.	Min.	Typ.	Max.	Units	Test Conditions
Input Operating Voltage	V_{IN}	**2.7**	—	**6.0**	V	**Note 1**
Maximum Output Current	I_{OUTMAX}	**100**	—	—	mA	**Note 1**
		150	—	—		V_{IN} >= 3V and V_{IN} >= (V_R + 2.5%) + $V_{DROPOUTMAX}$
Output Voltage	V_{OUT}	**V_R – 2.5%**	V_R ±0.5%	**V_R + 2.5%**	V	**Note 2**
V_{OUT} Temperature Coefficient	TCV_{OUT}	—	**40**	—	ppm/°C	**Note 3**
Line Regulation	$\|(\Delta V_{OUT}/\Delta V_{IN})\| / V_R$	—	0.04	**0.2**	%/V	(V_R + 1V) < V_{IN} < 6V
Load Regulation (**Note 4**)	$\|\Delta V_{OUT}\| / V_R$	—	0.38	**1.5**	%	I_L = 0.1 mA to I_{OUTMAX}
Dropout Voltage (**Note 5**)	$V_{IN} - V_{OUT}$	— — — —	2 90 180 285	**—** **200** **350** **500**	mV	I_L = 100 µA I_L = 50 mA I_L = 100 mA I_L = 150 mA
Supply Current	I_{IN}	—	53	**90**	µA	$\overline{SHDN} = V_{IH}$, I_L = 0
Shutdown Supply Current	I_{INSD}	—	0.05	2	µA	$\overline{SHDN}$ = 0V
Power Supply Rejection Ratio	PSRR	—	58	—	dB	f =1 kHz, I_L = 50 mA

Note 1: The minimum V_{IN} has to meet two conditions: $V_{IN} \geq 2.7V$ and $V_{IN} \geq (V_R + 2.5\%) + V_{DROPOUT}$.

2: V_R is the regulator voltage setting. For example: V_R = 1.8V, 2.7V, 2.8V, 3.0V.

3:
$$TCV_{OUT} = \frac{(V_{OUTMAX} - V_{OUTMIN}) \times 10^6}{V_{OUT} \times \Delta T}$$

4: Regulation is measured at a constant junction temperature using low duty-cycle pulse testing. Load regulation is tested over a load range from 0.1 mA to the maximum specified output current. Changes in output voltage due to heating effects are covered by the thermal regulation specification.

5: Dropout voltage is defined as the input-to-output differential at which the output voltage drops 2% below its nominal value at a 1V differential.

6: Thermal regulation is defined as the change in output voltage at a time T after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a current pulse equal to I_{LMAX} at V_{IN} = 6V for t = 10 msec.

7: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction-to-air (i.e., T_A, T_J, θ_{JA}). Exceeding the maximum allowable power dissipation causes the device to initiate thermal shutdown. Please see **Section 5.1 "Thermal Shutdown"**, for more details.

8: Output current is limited to 120 mA (typ) when V_{OUT} is less than 0.5V due to a load fault or short-circuit condition.

ELECTRICAL CHARACTERISTICS (CONTINUED)

Electrical Specifications: Unless otherwise noted, $V_{IN} = V_R + 1V$, $I_L = 100\ \mu A$, $C_L = 1.0\ \mu F$, $\overline{SHDN} > V_{IH}$, $T_A = +25°C$
Boldface type specifications apply for junction temperatures of –40°C to +125°C.

Parameter	Sym.	Min.	Typ.	Max.	Units	Test Conditions
Wake-Up Time (from Shutdown mode)	t_{WK}	—	10	—	µs	V_{IN} = 5V, I_L = 60 mA, $C_{IN} = C_{OUT}$ =1 µF, f = 100 Hz
Settling Time (from Shutdown mode)	t_S	—	32	—	µs	V_{IN} = 5V, I_L = 60 mA, C_{IN} = 1 µF, C_{OUT} = 1 µF, f = 100 Hz

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

Pin No. 5-Pin SC-70	Pin No. 5-Pin SOT-23 5-Pin SC-70R	Symbol	Description
1	3	$\overline{SHDN}$	Shutdown Control Input
2	4	NC	No Connect
3	2	GND	Ground Terminal
4	5	V_{OUT}	Regulated Voltage Output
5	1	V_{IN}	Unregulated Supply Input

3.1 Shutdown Control Input ($\overline{SHDN}$)

The regulator is fully enabled when a logic-high is applied to $\overline{SHDN}$. The regulator enters shutdown when a logic-low is applied to this input. During shutdown, the output voltage falls to zero and the supply current is reduced to 0.05 µA (typ.)

3.2 Ground Terminal

For best performance, it is recommended that the ground pin be tied to a ground plane.

3.3 Regulated Voltage Output (V_{OUT})

Bypass the regulated voltage output to GND with a minimum capacitance of 1 µF. A ceramic bypass capacitor is recommended for best performance.

3.4 Unregulated Supply Input (V_{IN})

The minimum V_{IN} has to meet two conditions in order to ensure that the output maintains regulation: $V_{IN} \geq 2.7V$ and $V_{IN} \geq [(V_R + 2.5\%) + V_{DROPOUT}]$. The maximum V_{IN} should be less than or equal to 6V. Power dissipation may limit V_{IN} to a lower potential in order to maintain a junction temperature below 125°C. Refer to **Section 5.0 "Thermal Considerations"**, for determining junction temperature.

It is recommended that V_{IN} be bypassed to GND with a ceramic capacitor.

4.0 DETAILED DESCRIPTION

The TC1017 is a precision, fixed-output, linear voltage regulator. The internal linear pass element is a P-channel MOSFET. As with all P-channel CMOS LDOs, there is a body drain diode with the cathode connected to V_{IN} and the anode connected to V_{OUT} (Figure 4-1).

As is shown in Figure 4-1, the output voltage of the LDO is sensed and divided down internally to reduce external component count. The internal error amplifier has a fixed bandgap reference on the inverting input and the sensed output voltage on the non-inverting input. The error amplifier output will pull the gate voltage down until the inputs of the error amplifier are equal to regulate the output voltage.

Output overload protection is implemented by sensing the current in the P-channel MOSFET. During a shorted or faulted load condition in which the output voltage falls to less than 0.5V, the output current is limited to a typical value of 120 mA. The current-limit protection helps prevent excessive current from damaging the Printed Circuit Board (PCB).

An internal thermal sensing device is used to monitor the junction temperature of the LDO. When the sensed temperature is over the set threshold of 160°C (typical), the P-channel MOSFET is turned off. When the P-channel is off, the power dissipation internal to the device is almost zero. The device cools until the junction temperature is approximately 150°C and the P-channel is turned on. If the internal power dissipation is still high enough for the junction to rise to 160°C, it will again shut off and cool. The maximum operating junction temperature of the device is 125°C. Steady-state operation at or near the 160°C overtemperature point can lead to permanent damage of the device.

The output voltage V_{OUT} remains stable over the entire input operating voltage range (2.7V to 6.0V) and the entire load range (0 mA to 150 mA). The output voltage is sensed through an internal resistor divider and compared with a precision internal voltage reference. Several fixed-output voltages are available by changing the value of the internal resistor divider.

Figure 4-2 shows a typical application circuit. The regulator is enabled any time the shutdown input pin is at or above V_{IH}. It is shut down (disabled) any time the shutdown input pin is below V_{IL}. For applications where the $\overline{SHDN}$ feature is not used, tie the $\overline{SHDN}$ pin directly to the input supply voltage source. While in shutdown, the supply current decreases to 0.006 µA (typical) and the P-channel MOSFET is turned off.

As shown in Figure 4-2, batteries have internal source impedance. An input capacitor is used to lower the input impedance of the LDO. In some applications, high input impedance can cause the LDO to become unstable. Adding more input capacitance can compensate for this.

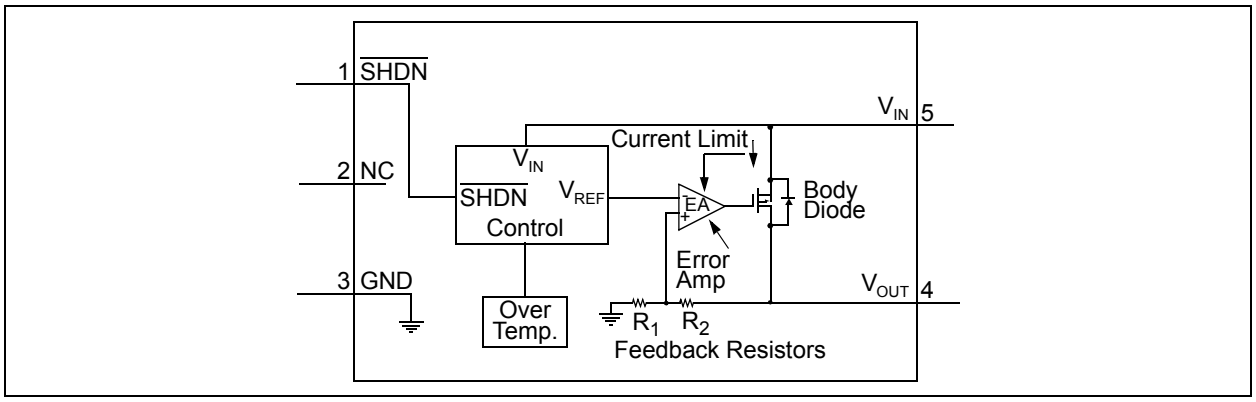

FIGURE 4-1: *TC1017 Block Diagram (5-Pin SC-70 Pinout).*

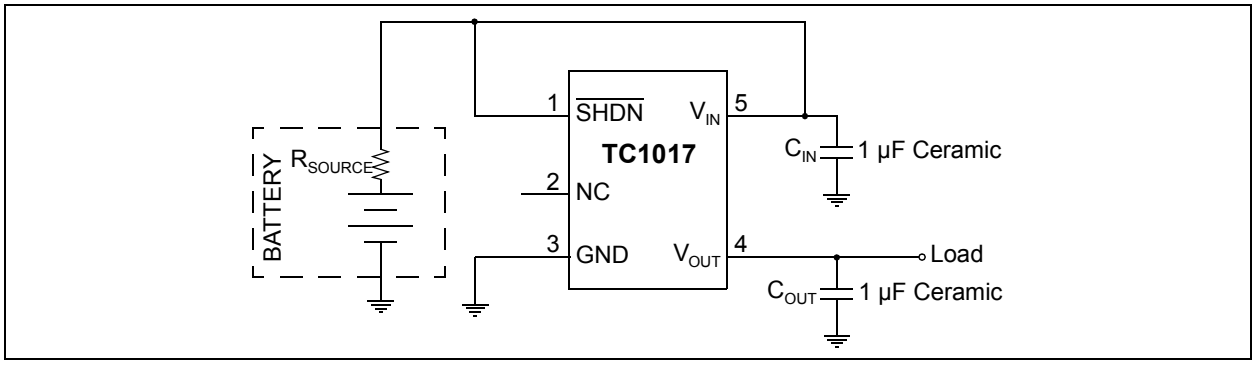

FIGURE 4-2: *Typical Application Circuit (5-Pin SC-70 Pinout).*

4.1 Input Capacitor

Low input source impedance is necessary for the LDO to operate properly. When operating from batteries, or in applications with long lead length (> 10") between the input source and the LDO, some input capacitance is required. A minimum of 0.1 µF is recommended for most applications and the capacitor should be placed as close to the input of the LDO as is practical. Larger input capacitors will help reduce the input impedance and further reduce any high-frequency noise on the input and output of the LDO.

4.2 Output Capacitor

A minimum output capacitance of 1 µF for the TC1017 is required for stability. The Equivalent Series Resistance (ESR) requirements on the output capacitor are between 0 and 2 ohms. The output capacitor should be located as close to the LDO output as is practical. Ceramic materials X7R and X5R have low temperature coefficients and are well within the acceptable ESR range required. A typical 1 µF X5R 0805 capacitor has an ESR of 50 milli-ohms. Larger output capacitors can be used with the TC1017 to improve dynamic behavior and input ripple-rejection performance.

Ceramic, aluminum electrolytic or tantalum capacitor types can be used. Since many aluminum electrolytic capacitors freeze at approximately –30°C, ceramic or solid tantalums are recommended for applications operating below –25°C. When operating from sources other than batteries, supply-noise rejection and transient response can be improved by increasing the value of the input and output capacitors and employing passive filtering techniques.

4.3 Turn-On Response

The turn-on response is defined as two separate response categories, wake-up time (t_{WK}) and settling time (t_S).

The TC1017 has a fast wake-up time (10 µsec, typical) when released from shutdown. See Figure 4-3 for the wake-up time designated as t_{WK}. The wake-up time is defined as the time it takes for the output to rise to 2% of the V_{OUT} value after being released from shutdown.

The total turn-on response is defined as the settling time (t_s) (see Figure 4-3). Settling time (inclusive with t_{WK}) is defined as the condition when the output is within 98% of its fully-enabled value (32 µsec, typical) when released from shutdown. The settling time of the output voltage is dependent on load conditions and output capacitance on V_{OUT} (RC response).

The table below demonstrates the typical turn-on response timing for different input voltage power-up frequencies: V_{OUT} = 2.85V, V_{IN} = 5.0V, I_{OUT} = 60 mA and C_{OUT} = 1 µF.

Frequency	Typical (t_{WK})	Typical (t_S)
1000 Hz	5.3 µsec	14 µsec
500 Hz	5.9 µsec	16 µsec
100 Hz	9.8 µsec	32 µsec
50 Hz	14.5 µsec	52 µsec
10 Hz	17.2 µsec	77 µsec

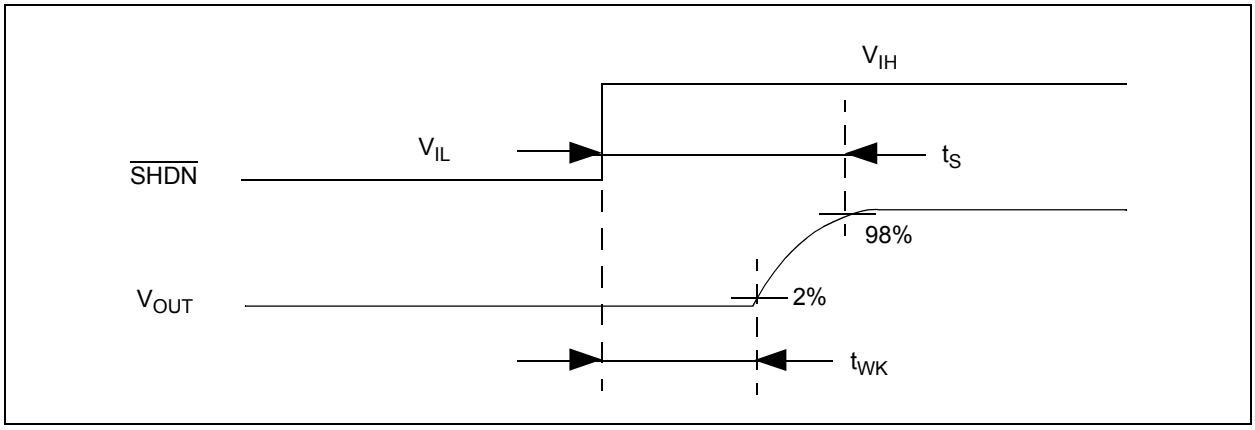

FIGURE 4-3: *Wake-Up Time from Shutdown.*

5.0 THERMAL CONSIDERATIONS

5.1 Thermal Shutdown

Integrated thermal protection circuitry shuts the regulator off when the die temperature exceeds approximately 160°C. The regulator remains off until the die temperature drops to approximately 150°C.

5.2 Power Dissipation: SC-70

The TC1017 is available in the SC-70 package. The thermal resistance for the SC-70 package is approximately 450°C/W when the copper area used in the PCB layout is similar to the JEDEC J51-7 high thermal conductivity standard or semi-G42-88 standard. For applications with a larger or thicker copper area, the thermal resistance can be lowered. See AN792, "*A Method to Determine How Much Power a SOT-23 Can Dissipate in an Application*" (DS00792), for a method to determine the thermal resistance for a particular application.

The TC1017 power dissipation capability is dependant upon several variables: input voltage, output voltage, load current, ambient temperature and maximum junction temperature. The absolute maximum steady-state junction temperature is rated at +125°C. The power dissipation within the device is equal to:

EQUATION 5-1:

$$P_D = (V_{IN} - V_{OUT}) \times I_{LOAD} + V_{IN} \times I_{GND}$$

The V_{IN} x I_{GND} term is typically very small when compared to the (V_{IN}–V_{OUT}) x I_{LOAD} term, simplifying the power dissipation within the LDO to be:

EQUATION 5-2:

$$P_D = (V_{IN} - V_{OUT}) \times I_{LOAD}$$

To determine the maximum power dissipation capability, the following equation is used:

EQUATION 5-3:

$$P_{DMAX} = \frac{(T_{J\_MAX} - T_{A\_MAX})}{R\theta_{JA}}$$

Where:

T_{J_MAX} = the maximum junction temperature allowed

T_{A_MAX} = the maximum ambient temperature

$R\theta_{JA}$ = the thermal resistance from junction to air

Given the following example:

V_{IN} = 3.0V to 4.1V

V_{OUT} = 2.85V ±2.5%

I_{LOAD} = 120 mA (output current)

T_A = 55°C (max. desired ambient)

Find:

1. Internal power dissipation:

$$\begin{aligned} P_{DMAX} &= (V_{IN\_MAX} - V_{OUT\_MIN}) \times I_{LOAD} \\ &= (4.1V - 2.85 \times (0.975)) \times 120mA \\ &= 158.5mW \end{aligned}$$

2. Maximum allowable ambient temperature:

$$\begin{aligned} T_{A\_MAX} &= T_{J\_MAX} - P_{DMAX} \times R\theta_{JA} \\ &= (125\,°C - 158.5mW \times 450\,°C/W) \\ &= (125\,°C - 71\,°C) \\ &= 54\,°C \end{aligned}$$

3. Maximum allowable power dissipation at desired ambient:

$$\begin{aligned} P_D &= \frac{T_{J\_MAX} - T_A}{R\theta_{JA}} \\ &= \frac{125\,°C - 55\,°C}{450\,°C/W} \\ &= 155mW \end{aligned}$$

In this example, the TC1017 dissipates approximately 158.5 mW and the junction temperature is raised 71°C over the ambient. The absolute maximum power dissipation is 155 mW when given a maximum ambient temperature of 55°C.

Input voltage, output voltage or load current limits can also be determined by substituting known values in the power dissipation equations.

Figure 5-1 and Figure 5-2 depict typical maximum power dissipation versus ambient temperature, as well as typical maximum current versus ambient temperature, with a 1V input voltage to output voltage differential, respectively.

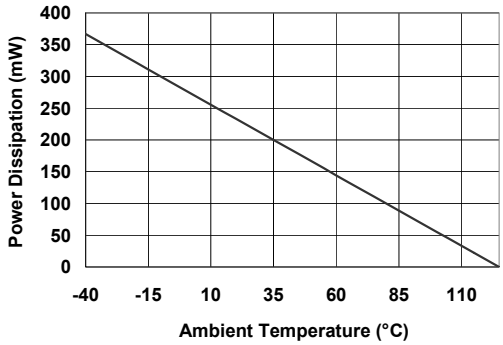

FIGURE 5-1: *Power Dissipation vs. Ambient Temperature (SC-70 package).*

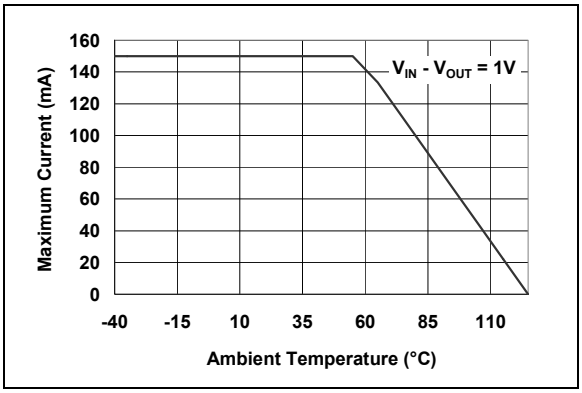

FIGURE 5-2: *Maximum Current vs. Ambient Temperature (SC-70 package).*

5.3 Power Dissipation: SOT-23

The TC1017 is also available in a SOT-23 package for improved thermal performance. The thermal resistance for the SOT-23 package is approximately 255°C/W when the copper area used in the printed circuit board layout is similar to the JEDEC J51-7 low thermal conductivity standard or semi-G42-88 standard. For applications with a larger or thicker copper area, the thermal resistance can be lowered. See AN792, "*A Method to Determine How Much Power a SOT-23 Can Dissipate in an Application*" (DS00792), for a method to determine the thermal resistance for a particular application.

The TC1017 power dissipation capability is dependant upon several variables: input voltage, output voltage, load current, ambient temperature and maximum junction temperature. The absolute maximum steady-state junction temperature is rated at +125°C. The power dissipation within the device is equal to:

EQUATION 5-4:

$$P_D = (V_{IN} - V_{OUT}) \times I_{LOAD} + V_{IN} \times I_{GND}$$

The V_{IN} x I_{GND} term is typically very small when compared to the (V_{IN}–V_{OUT}) x I_{LOAD} term, simplifying the power dissipation within the LDO to be:

EQUATION 5-5:

$$P_D = (V_{IN} - V_{OUT}) \times I_{LOAD}$$

To determine the maximum power dissipation capability, the following equation is used:

EQUATION 5-6:

$$P_{DMAX} = \frac{(T_{J\_MAX} - T_{A\_MAX})}{R\theta_{JA}}$$

Where:

T_{J_MAX} = the maximum junction temperature allowed

T_{A_MAX} = the maximum ambient temperature

$R\theta_{JA}$ = the thermal resistance from junction to air

Given the following example:

V_{IN} = 3.0V to 4.1V

V_{OUT} = 2.85V ±2.5%

I_{LOAD} = 120 mA (output current)

T_A = +85°C (max. desired ambient)

Find:

1. Internal power dissipation:

$$\begin{aligned} P_{DMAX} &= (V_{IN\_MAX} - V_{OUT\_MIN}) \times I_{LOAD} \\ &= (4.1V - 2.85 \times (0.975)) \times 120mA \\ &= 158.5mW \end{aligned}$$

2. Maximum allowable ambient temperature:

$$\begin{aligned} T_{A\_MAX} &= T_{J\_MAX} - P_{DMAX} \times R\theta_{JA} \\ &= (125\,°C - 158.5mW \times 255\,°C/W) \\ &= (125\,°C - 40.5\,°C) \\ &= 84.5\,°C \end{aligned}$$

3. Maximum allowable power dissipation at desired ambient:

$$\begin{aligned} P_D &= \frac{T_{J\_MAX} - T_A}{R\theta_{JA}} \\ &= \frac{125\,°C - 85\,°C}{255\,°C/W} \\ &= 157mW \end{aligned}$$

In this example, the TC1017 dissipates approximately 158.5 mW and the junction temperature is raised 40.5°C over the ambient. The absolute maximum power dissipation is 157 mW when given a maximum ambient temperature of +85°C.

Input voltage, output voltage or load current limits can also be determined by substituting known values in the power dissipation equations.

Figure 5-3 and Figure 5-4 depict typical maximum power dissipation versus ambient temperature, as well as typical maximum current versus ambient temperature with a 1V input voltage to output voltage differential, respectively.

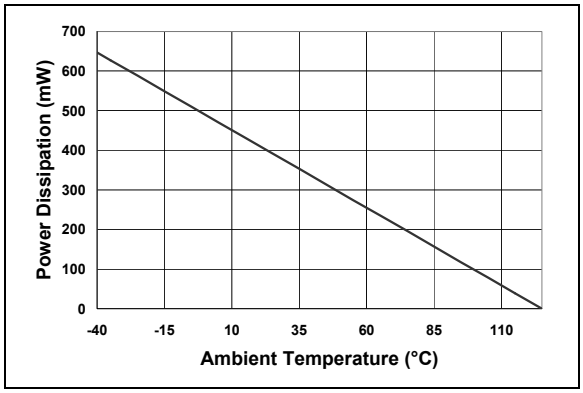

FIGURE 5-3: *Power Dissipation vs. Ambient Temperature (SOT-23 Package).*

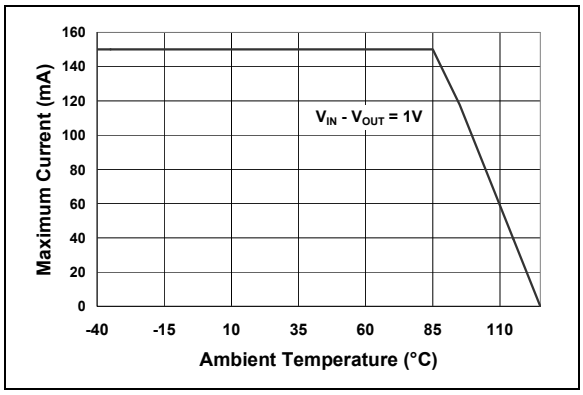

FIGURE 5-4: *Maximum Current vs. Ambient Temperature (SOT-23 Package).*

5.4 Layout Considerations

The primary path for heat conduction out of the SC-70/ SOT-23 package is through the package leads. Using heavy, wide traces at the pads of the device will facilitate the removal of the heat within the package, thus lowering the thermal resistance $R\theta_{JA}$. By lowering the thermal resistance, the maximum internal power dissipation capability of the package is increased.

Molded Package Thickness	A2	0.80	–	1.00
Standoff	A1	0.00	–	0.10
Overall Width	E	1.80	2.10	2.40
Molded Package Width	E1	1.15	1.25	1.35
Overall Length	D	1.80	2.00	2.25
Foot Length	L	0.10	0.20	0.46
Lead Thickness	c	0.08	–	0.26
Lead Width	b	0.15	–	0.40

Notes:

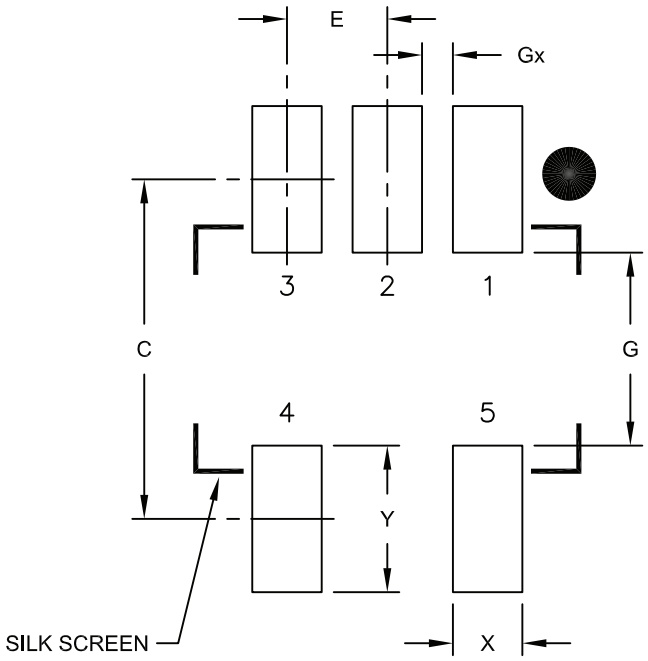
1. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.127 mm per side.
2. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing C04-061B

5-Lead Plastic Small Outline Transistor (LT) [SC70]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E	0.65 BSC		
Contact Pad Spacing	C		2.20	
Contact Pad Width	X			0.45
Contact Pad Length	Y			0.95
Distance Between Pads	G	1.25		
Distance Between Pads	Gx	0.20		

Notes:

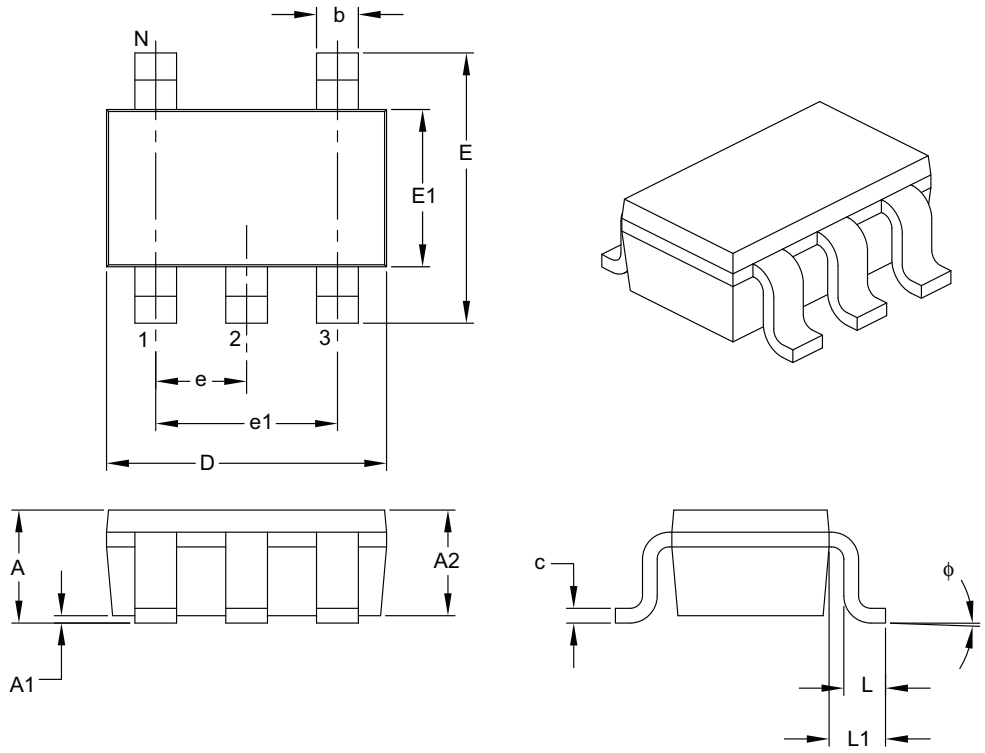
1. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing No. C04-2061A

5-Lead Plastic Small Outline Transistor (OT) [SOT-23]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Pins	N		5	
Lead Pitch	e		0.95 BSC	
Outside Lead Pitch	e1		1.90 BSC	
Overall Height	A	0.90	–	1.45
Molded Package Thickness	A2	0.89	–	1.30
Standoff	A1	0.00	–	0.15
Overall Width	E	2.20	–	3.20
Molded Package Width	E1	1.30	–	1.80
Overall Length	D	2.70	–	3.10
Foot Length	L	0.10	–	0.60
Footprint	L1	0.35	–	0.80
Foot Angle	ϕ	0°	–	30°
Lead Thickness	c	0.08	–	0.26
Lead Width	b	0.20	–	0.51

Notes:

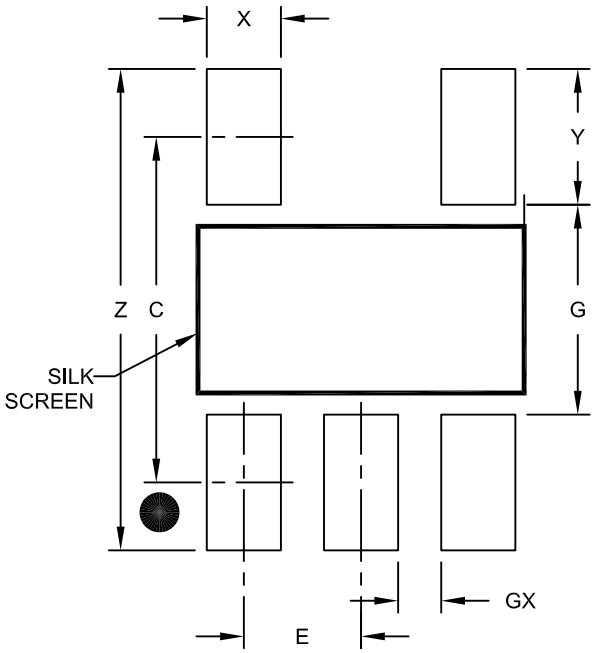
1. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.127 mm per side.
2. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing C04-091B

5-Lead Plastic Small Outline Transistor (OT) [SOT-23]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E		0.95 BSC	
Contact Pad Spacing	C		2.80	
Contact Pad Width (X5)	X			0.60
Contact Pad Length (X5)	Y			1.10
Distance Between Pads	G	1.70		
Distance Between Pads	GX	0.35		
Overall Width	Z			3.90

Notes:

1. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing No. C04-2091A

NOTES:

APPENDIX A: REVISION HISTORY

Revision F (April 2013)

The following is the list of modifications:

- Updated the information for the Maximum Output Current parameter in the Electrical Characteristics table.

Revision E (January 2013)

- Added a note to each package outline drawing.

Revision D (February 2005)

- Undocumented changes.

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	X.XX	X	XXXX
Device	Voltage Options	Temperature Range	Package

Device:	TC1017: 150 mA Tiny CMOS LDO with Shutdown TC1017R:150 mA Tiny CMOS LDO with Shutdown (SC-70 only)	
Voltage Options:*	1.8V	
(Standard)	1.85V	
	2.5V	SC-70 only
	2.6V	
	2.7V	
	2.8V	
	2.85V	
	2.9V	
	3.0V	
	3.2V	SC-70 only
	3.3V	
	4.0V	
	* Other voltage options available. Please contact your local Microchip sales office for details.	
Temperature Range:	V = -40°C to +125°C	
Package:	LTTR = 5-pin SC-70 (Tape and Reel) CTTR = 5-pin SOT-23 (Tape and Reel)	

Examples:

a) TC1017-1.8VLTTR: 150 mA, Tiny CMOS LDO with Shutdown, SC-70 package.

b) TC1017R-1.8VLTTR:150mA, Tiny CMOS LDO with Shutdown, SC-70R package.

c) TC1017-2.6VCTTR: 150 mA, Tiny CMOS LDO with Shutdown, SOT-23 package.

d) TC1017-2.7VLTTR: 150 mA, Tiny CMOS LDO with Shutdown, SC-70 package.

e) TC1017-2.8VCTTR: 150 mA, Tiny CMOS LDO with Shutdown, SOT-23 package.

f) TC1017-2.85VLTTR:150 mA, Tiny CMOS LDO with Shutdown, SC-70 package.

g) TC1017-2.9VCTTR: 150 mA, Tiny CMOS LDO with Shutdown, SOT-23 package.

h) TC1017-3.0VLTTR: 150 mA, Tiny CMOS LDO with Shutdown, SC-70 package.

i) TC1017-3.3VCTTR: 150 mA, Tiny CMOS LDO with Shutdown, SOT-23 package.

j) TC1017-4.0VLTTR: 150 mA, Tiny CMOS LDO with Shutdown, SC-70 package.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
ISO/TS 16949

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
