Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 1: All parameters are production tested at $T_A = +25^{\circ}C$ and guaranteed by design over the specified temperature range.

Note 2: Signals on X, Y, X_{-} , or Y_{-} exceeding V_{CC} are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Note 3: Guaranteed by design; not production tested.

Note 4: $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$.

Note 5: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges.

Note 6: X Off-Isolation = $20\log_{10} [V_X / V_{X_{-}}]$, V_X = output, $V_{X_{-}}$ = input to off switch. Y Off-Isolation = $20\log_{10} [V_Y / V_{Y_{-}}]$, V_Y = output, $V_{Y_{-}}$ = input to off switch.

Detailed Description

The MAX4908/MAX4909/MAX4930/MAX4932 dual 3:1 clickless audio multiplexers are low 0.38Ω (typ) on-resistance, low 150nA (typ) supply current, high power-supply rejection ratio (PSRR) devices that operate from a +1.8V to +5.5V single supply. These devices feature a negative signal capability that allows signals below GND to pass through without distortion and break-before-make switching.

The MAX4908/MAX4909/MAX4930/MAX4932 use two digital control bits CB1 and CB2 to switch between signals (see [Table 1](#)). The MAX4908 has shunt resistors on all the unselected terminals to suppress click-and-pop sounds that may occur from switching to a precharged terminal. The MAX4909 does not have click-and-pop suppression resistors on X0 and Y0 terminals for applications that do not require predischARGE switching. The MAX4930 only has shunt resistors on X2 and Y2 terminals. The MAX4932 has no shunt resistors on all terminals.

CB1	CB2	COMMON X	COMMON Y
0	0	High Impedance	High Impedance
0	1	Connected to X0	Connected to Y0
1	0	Connected to X1	Connected to Y1
1	1	Connected to X2	Connected to Y2

Applications Information

Digital Control Inputs

The MAX4908/MAX4909/MAX4930/MAX4932 logic inputs accept up to +5.5V regardless of supply voltage. For example, with a +3.3V supply, CB_ can be driven low to GND and high to +5.5V, allowing for mixing of logic levels in a system. Driving CB_ rail-to-rail minimizes power consumption. For a +3.3V supply voltage, the logic thresholds are +0.5V (low) and +1.4V (high).

Analog Signal Levels

These devices have a low on-resistance of 0.38Ω (typ) and the on-resistance flatness is guaranteed over temperature and will show minimal variation over the entire voltage supply range (see the [Typical Operating Characteristics](#)). The on-resistance flatness and low-leakage features make it ideal for bidirectional operation. The switches are bidirectional, so X_, Y_, and common terminals X and Y pins can be either inputs or outputs.

These devices pass signals as low as $V_{CC} - 5.5V$, including signals below ground with minimal distortion.

Click-Pop Suppression

The MAX4908 has a $3.8k\Omega$ (typ) shunt resistor on all of its input terminals to automatically discharge any capacitance when they are not connected to common terminal X and Y. The MAX4909 has shunt resistors on all terminals except X0 and Y0. The MAX4930 only has shunt resistors on X2 and Y2. The shunt resistors reduce audible click-and-pop sounds that occur when switching between audio sources.

Audible clicks and pops are caused when a step DC voltage is switched into the speaker. The DC step transients can be reduced by automatically discharging the side that is not connected to the common terminal, thus reducing any residual DC voltage and clicks and pops.

Break-Before-Make Switching

The MAX4908/MAX4909/MAX4930/MAX4932 feature break-before-make switching, which is configured to break (open) the first set of contacts before engaging (closing) the new contacts. This prevents the momentary connection of the old and new signal paths to the output, further reducing click-and-pop sounds.

Power-Supply Sequencing and Overvoltage Protection

Caution: Do not exceed the Absolute Maximum Ratings since stresses beyond the listed ratings may cause permanent damage to the device.

Proper power-supply sequencing is recommended for all CMOS devices. Improper supply sequencing can force the switch into latchup, causing it to draw excessive supply current. The only way out of latchup is to recycle the power and reapply properly. Connect all ground pins first, apply power to V_{CC} , and finally apply signals to X_, Y_, and common terminals. Follow the reverse order upon power-down.
