

## OVERVIEW

- Baud rate speeds: 1,200 bps up to 921 Kbps, non-standard baud rates can be programmed
- Class 1 radio, 330' (100 m) range, 15 dBm output transmitter, -80 dBm typical receive sensitivity
- Frequency 2,402 ~ 2,480 MHz
- FHSS/GFSK modulation, 79 channels at 1-MHz intervals
- Secure communication, 128-bit encryption
- Error correction for guaranteed packet delivery
- Configuration via the local UART and over-the-air RF
- Auto-discovery/pairing does not require software configuration (supports instant cable replacement)
- Auto-connect master, I/O pin (DTR), and character-based trigger modes

The module's moisture sensitivity level (MSL) is 1. Table 1 shows the module's size and weight.

**Table 1. Module Size & Weight**

Parameter	RN-41	RN-41-N	Units
Size	13.4 x 25.8 x 2	13.4 x 19 x 2	mm
Weight	0.055	0.020	Oz.

Tables 2 through 5 provide detailed specifications for the module.

**Table 2. Environmental Conditions**

Parameter	Value
Temperature Range (Operating)	-40° C ~ 85° C
Temperature Range (Storage)	-40° C ~ 85° C
Relative Humidity (Operating)	≤ 90%
Relative Humidity (Storage)	≤ 90%

**Table 3. Electrical Characteristics**

Parameter	Min.	Typ.	Max.	Units
Supply Voltage (DC)	3.0	3.3	3.6	V
RX Supply Current		35	60	mA
TX Supply Current		65	100	mA
<b>Average Power Consumption</b>				
Standby/Idle (Default Settings)		25		mA
Connected (Normal Mode)		30		mA
Connected (Low-Power Sniff)		8		mA
Standby/Idle (Deep Sleep Enabled)	250	2.5		mA

**Table 4. Radio Characteristics**

Parameter	Frequency (GHz)	Min.	Typ.	Max.	Bluetooth Specification	Units
Sensitivity at 0.1% BER	2.402	-	-80	-86	$\leq -70$	dBm
	2.441	-	-80	-86		dBm
	2.480	-	-80	-86		dBm
RF Transmit Power	2.402	15.0	16.0		$\leq 20$	dBm
	2.441	15.0	16.0			dBm
	2.480	15.0	16.0			dBm
Initial Carrier Frequency Tolerance	2.402	-	5	75	75	kHz
	2.441	-	5	75		kHz
	2.480	-	5	75		kHz
20-dB Bandwidth for Modulated Carrier		-	900	1000	$\leq 1000$	kHz
Drift (Five Slots Packet)		-	15	-	40	kHz
Drift Rate		-	13	-	20	kHz
$\Delta f_{1\text{avg}}$ Maximum Modulation	2.402	140	165	175	$> 140$	kHz
	2.441	140	165	175		kHz
	2.480	140	165	175		kHz
$\Delta f_{2\text{avg}}$ Minimum Modulation	2.402	140	190	-	115	kHz
	2.441	140	190	-		kHz
	2.480	140	190	-		kHz

**Table 5. Digital I/O Characteristics**

<b>3.0 V <math>\leq</math> VDD <math>\leq</math> 3.3 V</b>	Min.	Typ.	Max.	Units
Input Logic Level Low	-0.4	-	+0.8	V
Input Logic Level High	0.7 VDD	-	VDD + 0.4	V
Output Logic Level Low	-	-	0.2	V
Output Logic Level High	VDD - 0.2	-	-	V
All I/O pins (Except reset) Default to Weak Pull Down	+0.2	+1.0	+5.0	$\mu$ A

Figure 2 shows the pinout and Table 6 describes the pins.

**Figure 2. RN-41/RN-41-N Pinout**

**Table 6. Pin Description**

Pin	Name	Description	Default
1	GND	Ground	–
2	SPI_MOSI	Programming only	No connect
3	GPIO6	Set Bluetooth master (high = auto-master mode)	Input to RN-41 with weak pulldown
4	GPIO7	Set baud rate (high = force 9,600, low = 115 K or firmware setting)	Input to RN-41 with weak pulldown
5	RESET	Active-low reset	Input to RN-41 with 1K pullup
6	SPI_CLK	Programming only	No Connect
7	PCM_CLK	PCM interface	No Connect
8	PCM_SYNC	PCM interface	No Connect
9	PCM_IN	PCM interface	No Connect
10	PCM_OUT	PCM interface	No Connect
11	VDD	3.3-V regulated power input	–
12	GND	Ground	–
13	UART_RX	UART receive input	Input to RN-41
14	UART_TX	UART transmit output	High level output from RN-41
15	UART_RTS	UART RTS, goes high to disable host transmitter	Low level output from RN-41
16	UART_CTS	UART CTS, if set high, it disables transmitter	Low level input to RN-41

Pin	Name	Description	Default
17	USB_D+	USB port	1.5 K pullup activated when USB port is ready (~500 ms after reset)
18	USB_D-	USB port	–
19	GPIO2	Status, high when connected, low otherwise	Output from RN-41
20	GPIO3	Auto discovery = high	Input to RN-41 with weak pulldown
21	GPIO5	Status, toggles based on state, low on connect	Output from RN-41
22	GPIO4	Set factory defaults	Input to RN-41 with weak pulldown
23	SPI_CSB	Programming only	No connect
24	SPI_MISO	Programming only	No connect
25 - 27	NC	RF pad, keep all traces and planes clear	–
28 - 29	GND	Ground	–
30	AIO0	Optional analog input	Not used
31	GPIO8	Status (RF data RX/TX)	Output from RN-41
32	GPIO9	I/O	Input to RN-41 with weak pulldown
33	GPIO10	I/O (remote DTR signal)	Input to RN-41 with weak pulldown
34	GPIO11	I/O (remote RTS signal)	Input to RN-41 with weak pulldown
35	AIO1	Optional analog input	Not Used

Figure 3 shows the module's physical dimensions.

**Figure 3. RN-41/RN-41-N Physical Dimensions**

Figure 4 shows a typical application schematic.

**SIGNAL FUNCTION**

PIO2	CONNECT= HIGH
PIO3	AUTO PAIRING
PIO4	FACTORY RESET
PIO5	STATUS LED
PIO6	AUTO MASTER/DTR
PIO7	BAUDRATE

## DESIGN CONCERNS

---

The following sections provide information on designing with the RN-41 module, including radio interference, factory reset, solder reflow profile, connection status, etc.

### Reset Circuit

The RN-41 contains a 1k pullup to VCC, and the reset polarity is active low. The module's reset pin has an optional power-on-reset circuit with a delay, which should only be required if the input power supply has a very slow ramp or tends to bounce or have instability on power up. Often a microcontroller or embedded CPU I/O is available to generate the reset once power is stable. If not, designers can use one of the many low-cost power supervisor chips currently available, such as the MCP809, MCP102/121, and Torex XC61F.

### Factory Reset Using GPIO4

Roving Networks recommends that designers connect the GPIO4 pin to a switch, jumper, or resistor so it can be accessed. This pin can be used to reset the module to its factory default settings, which is critical in situations where the module has been misconfigured. To reset the module to the factory defaults, GPIO4 should be high on power-up and then toggle low, high, low, high with a 1 second wait between the transitions.

### Connection Status

GPIO5 is available to drive an LED, and it blinks at various speeds to indicate status (see Table 7). GPIO2 is an output that directly reflects the connection state as shown in Table 8.

**Table 7. GPIO5 Status**

GPIO5 Status	Description
Toggle at 1 Hz	The module is discoverable and waiting for a connection.
Toggle at 10 Hz	The module is in command mode.
Low	The module is connected to another device over Bluetooth.

**Table 8. GPIO2 Status**

GPIO2 Status	Description
High	The module is connected to another device over Bluetooth.
Low	The module is not connected over Bluetooth.

### HCI Mode

Roving Networks offers the Host Controller Interface (HCI) mode in addition to the standard operational mode of its Bluetooth modules (standard mode refers to the on-board stack running on the module).

In HCI mode, the on-board stack is bypassed and the module is put in a state that runs the Bluetooth baseband. The HCI provides a command reference interface to the baseband controller and the link manager, and provides access to the hardware status and control registers. This interface provides a uniform method for accessing the Bluetooth baseband capabilities.

In this mode, the Bluetooth stack is no longer on-board the module. It is offloaded to the interfacing host processor. The Bluetooth module is used as a radio, performing the lower level MAC functionalities, while the application stack runs on the host processor.

Using the module in HCI mode allows designers to implement profiles that are not natively supported on the Bluetooth module.

**NOTE:** HCI mode requires a separate firmware build that must be loaded into the module's flash at the factory. Is not upgradeable in the field.

Roving Networks offers HCI mode in two hardware interfaces:

- HCI over UART
- HCI over USB

### *HCI over UART*

In this mode, the hardware interface between the host processor and the Bluetooth module is the UART. You must interface the flow control signals between the host processor and the Bluetooth module for the HCI interface to work. Failure to do so can cause the host processor and the Bluetooth module to become out of sync and break the Bluetooth link.

### *HCI over USB*

In this mode, the hardware interface between the host processor and the Bluetooth module is the USB. In this architecture, the Bluetooth module is the USB slave and the host processor is the USB host.

Using the USB interface offers the advantage of a faster data link between the Bluetooth module and the host processor. With this architecture, it is possible to achieve Bluetooth's theoretical maximum throughput of 3 Mbps.

## **Using the SPI Bus to Upgrade the Flash Memory**

While not required, this bus is very useful for configuring the Bluetooth modules' advanced parameters. The bus is required when upgrading the module's firmware. The typical application schematic shown in Figure 4 shows a 6-pin header that can be implemented to gain access to this bus. A minimum-mode version might simply use the SPI signals (4 pins) and obtain ground and VCC from elsewhere in the design.

## **Minimizing Radio Interference**

When laying out the carrier board for the RN-41 module, the areas under the antenna and shielding connections should not have surface traces, ground planes, or exposed vias (see Figure 5). For optimal radio performance, the RN-41 module's antenna end should protrude at least 5 mm beyond any metal enclosure.

**Figure 5. Minimizing Radio Interference**

Because the RN-41-N does not contain an antenna, it does not carry regulatory approvals.

If designers use Roving Networks recommended design, they can file for a permissible antenna change and use Roving Networks' regulatory approvals. Roving Networks recommends the Yageo chip antenna for the RN-41-N module. For detailed information on this antenna, refer to the Yageo chip antenna data sheet on the Support page of the Roving Networks website at [http://www.rovingnetworks.com/Support\\_Overview](http://www.rovingnetworks.com/Support_Overview).

If designers choose to use another antenna, they must go through the regulatory approval process.

## Solder Reflow Profile

The lead-free solder reflow temperature and times are:

- *Temperature*—230° C, 30 - 40 seconds, peak 250° C maximum
- *Preheat temperature*—165° ± 15° C, 90 to 120 seconds
- *Time*—Single pass, one time

## COMPLIANCE INFORMATION

Table 9 describes the module's compliance information.

**Table 9. Compliance Information (RN-41 Only)**

Category	Country	Standard
Radio	USA FCC ID:	FCC CFR47 Part 15 C, para 15.247
		T9J-R41-1
	Europe	EN 300 328-1
		EN 300 328-2 2.4GHz
	Canada IC Canada ID:	IC RSS-210 low power comm. device 6514A-RN411
EMC	USA	FCC CFR47 Part 15 subclass B
	Europe	EN 55022 Class B radiated
		EN61000-4-2 ESD immunity
		EN61000-4-3 radiated field
		EN61000-4-6 RF immunity
		EN61000-4-8 power magnetic immunity
Bluetooth	LISTED	B013180
Environmental	RoHS	RoHS compliant

## ORDERING INFORMATION

Table 10 provides ordering information.

**Table 10. Ordering Information**

Part Number	Description
RN-41	Standard Application firmware (SPP/DUN Master and Slave).
RN-41-HCI	HCI firmware (HCI over H4 UART).
RN-41-USB	USB firmware (HCI over USB port, slave device at 12-Mbps rate).
RN-41-HID	HID firmware supporting HID device and SPP profiles.
RN-41-N	Standard application firmware (SPP and DUN) without antenna.
RN-41-N-HCI	HCI firmware (HCI over H4 UART) without antenna.
RN-41-N-USB	USB firmware (HCI over USB port, slave device at 12-Mbps rate) without antenna.
RN-41-N-HID	HID firmware supporting HID device and SPP profiles without antenna.
For other configurations, contact Roving Networks directly.

## REVISION HISTORY

---

### Version 3.41r 10/15/2012

- Updated the GPIO5 status table to correctly show that when GPIO5 is low, it indicates that the module is connected to another device over Bluetooth.
