Thermal Characteristics

Symbol	Parameter	Value	Unit
$R_{\theta JC}$	Junction to case (bottom)	15	$^\circ\text{C/W}$
$R_{\theta JA}$	Junction to ambient ⁽³⁾	240	$^\circ\text{C/W}$

⁽³⁾ Mounted on FR-4 PC board using 1oz copper with recommended minimum foot print

Reverse power dissipation and the possibility of thermal runaway must be considered when operating this device under any reverse voltage conditions. Calculations of T_J therefore must include forward and reverse power effects. The allowable operating T_J may be calculated from the equation:

$T_J = T_{J\max} = r(t)(P_f + P_r)$ where
 $r(t)$ = thermal impedance under given conditions.
 P_f = forward power dissipation, and
 P_r = reverse power dissipation

This graph displays the de-rated allowable T_J due to reverse bias under DC conditions only and is calculated as $T_J = T_{J\max} - r(t) P_r$, Where $r(t) = R_{\theta JA}$. For other power applications further calculations must be performed.
