

Pin Descriptions

Pin Number	Pin Name	Function
1	DRISR	Synchronous rectification MOSFET drive
2	VDET	Synchronous rectification sense input and dynamic function output, connected to DRAIN through a resistor
3	AREF	Program a voltage reference with a resistor from AREF to GND, to enable synchronous rectification MOSFET drive signal
4	VCC	Power supply, connected with system output
5, 6	GND	Source pin of internal MOSFET, connected to Ground
7, 8	DRAIN	Drain pin of internal MOSFET

Functional Block Diagram

Absolute Maximum Ratings (Note 4)

Symbol	Parameter	Value	Unit
V _{cc}	Supply Voltage	-0.3 to 7.5	V
$V_{\text{DET}}, V_{\text{DRAIN}}$	Voltage at VDET, DRAIN Pin	-2 to 50	V
V _{AREF} , V _{DRISR}	Voltage at AREF, DRISR Pin	-0.3 to 6	V
I _D	Continuous Drain Current	15	А
I _{DM}	Pulsed Drain Current	60	A
P_D	Power Dissipation at T _A =+25°C	0.7	W
θ_{JA}	Thermal Resistance (Junction to Ambient) (Note 5)	170	°C/W
θ _{JC}	Thermal Resistance (Junction to Case) (Note 5)	24	°C/W
TJ	Operating Junction Temperature	+150	°C
T _{STG}	Storage Temperature	-65 to +150	°C
T_LEAD	Lead Temperature (Soldering, 10 sec)	+300	°C

Notes:

Recommended Operating Conditions

Symbol	Parameter	Min	Max	Unit
V _{cc}	Supply Voltage	3.3	6	V
T _A	Ambient Temperature	-40	+85	°C

^{4.} Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

^{5.} FR-4 substrate PC board, 2oz copper, with 1 inch² pad layout.

Electrical Characteristics (@T_A = +25°C, V_{CC} =5V, unless otherwise specified.)

Output Voltage Detect Function Description

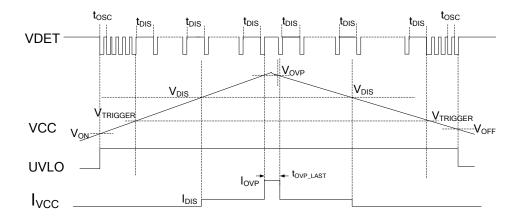

Figure 1. Typical Waveforms of APR3415

When V_{CC} is beyond power-on voltage (V_{ON}) , the APR3415 starts up. The VDET pin asserts a periodical pulse and the oscillation period is t_{OSC} . When V_{CC} is beyond the trigger voltage $(V_{TRIGGER})$, the periodical pulse at VDET pin is discontinued. When V_{CC} is beyond the discharge voltage (V_{DIS}) , the discharge circuit will be enabled, and a 3mA current (I_{DIS}) will flow into VCC pin. When V_{CC} is higher than the overshoot voltage (V_{OVP}) , the APR3415 will enable a discharge circuit, the discharge current (I_{OVP}) will last t_{OVP_LAST} time. After the t_{OVP_LAST} time, APR3415 will stop the discharge current and detect VCC voltage again. If V_{CC} is still higher than V_{OVP} , the t_{OVP_LAST} time discharge current will be enabled again. Once the OVP discharge current is asserted, the periodical pulse at VDET pin will be disabled.

When the V_{CC} falls below the power-off voltage (V_{OFF}), the APR3415 will shut down.

Operation Description

MOSFET Driver

The operation of the SR is described with timing diagram shown in Figure 2. APR3415 monitors the MOSFET drain-source voltage. When the drain voltage is lower than the turn-on threshold voltage V_{THON} , the IC outputs a positive drive voltage after a turn-on delay time (t_{DON}). The MOSFET will turn on and the current will transfer from the body diode into the MOSFET's channel.

In the process of drain current decreasing linearly toward zero, the drain-source voltage rises synchronically. When it rises over the turn off threshold voltage V_{THOFF} , APR3415 pulls the drive signal down after a turn off delay (t_{DOFF}).

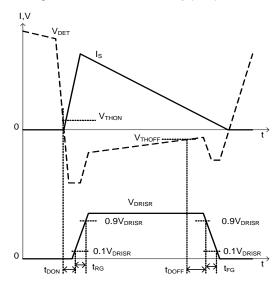

Figure 2. Typical Waveforms of APR3415

Operation Description (Cont.)

Minimum On Time

When the controlled MOSFET gate is turned on, some ringing noise is generated. The minimum on-time timer blanks the V_{THOFF} comparator, keeping the controlled MOSFET on for at least the minimum on time. If V_{THOFF} falls below the threshold before minimum on time expires, the MOSFET will keep on until the end of the minimum on time.

The minimum on time is in direct proportion to the (V_{DET}-V_{CC})*t_{ONP}. When (V_{DET}-V_{CC})*t_{ONP}=5V*5µs, the minimum on time is about 1.8µs.

The Value and Meaning of AREF Resistor

As to DCM operation Flyback converter, after secondary rectifier stops conduction the primary MOSFET Drain-to-source ringing waveform is resulted from the resonant of primary inductance and equivalent switch device output capacitance. This ringing waveform probably leads to Synchronous Rectifier error conduction. To avoid this fault happening, APR3415 has a special function design by means of volt-second product detecting. From the sensed voltage of VDET pin to see, the volt-second product of voltage above VCC at primary switch on time is much higher than the volt-second product of each cycle ringing voltage above V_{CC} . Therefore, before every time Synchronous Rectifier turning on, APR3415 judges if the detected volt-second product of VDET voltage above V_{CC} is higher than a threshold and then turn on synchronous Rectifier. The purpose of AREF resistor is to determine the volt-second product threshold. APR3415 has a parameter, Kqs, which converts R_{AREF} value to volt-second product.

Area
$$2 = R_{AREF} * Kqs$$

In general, Area1 and Area3, the value of which should be test on system, depend on system design and always are fixed after system design frozen. As to BCD PSR design, the Area1 value changes with primary peak current value and Area3 value generally keeps constant at all of conditions. So the AREF resistor design should consider the worst case, the minimum primary peak current condition. Since of system design parameter distribution, Area1 and Area3 have moderate tolerance. So Area2 should be designed between the middle of Area1 and Area3 to keep enough design margin.

Area3 < R AREF * Kqs < Area1

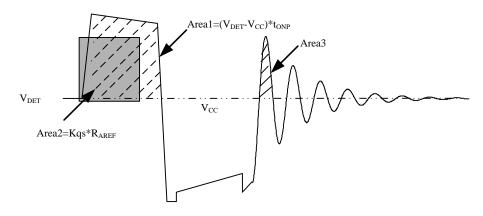

Figure 3. AREF Function

SR Minimum Operating Voltage

APR3415 sets a minimum SR operating voltage by comparing the difference between V_{DET} and output voltage (V_{CC}). The value of V_{DET} – V_{CC} must be higher than its internal reference, then APR3415 will begin to integrate the area of $(V_{DET}$ – $V_{CC})$ * t_{ONP} . If not, the area integrating will not begin and the SR driver will be disabled.

SR Turning off Timing Impact on PSR CV Sampling

As to synchronous rectification on Flyback power system, SR MOSFET need to turn off in advance of secondary side current decreasing to zero to avoid current flowing reversely. When SR turns off in advance, the secondary current will flow through the body diode. The SR turning off time is determined by the V_{THOFF} at a fixed system. When V_{THOFF} is more close to zero, the SR turning on time gets longer and body diode conduction time gets shorter. Since of the different voltage drop between SR MOSFET and body diode, the PSR feedback signal V_{FB} appears a voltage jump at the time of SR MOSFET turning off. If the PSR CV sampling time t_{SAMPLE} is close to even behind this voltage jump time, there will be system unstable operation issue or the lower output voltage issue.

Operation Description (Cont.)

To ensure stable operating of system, it must be met:

 $t_{BODYDIODE} < t_{ONS}^* (1 - t_{SAMPLE})$

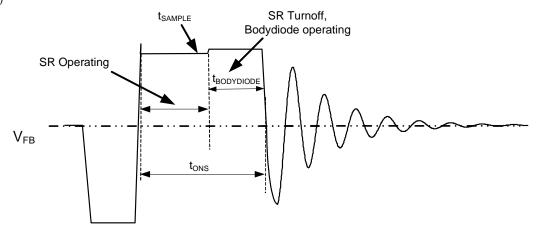

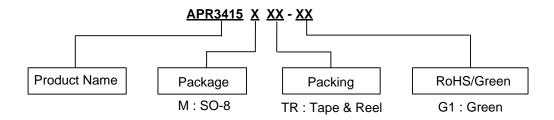

Figure 4. SR Turning off Timing Impact on PSR CV Sampling

Recommended Application Circuit Parameters

The two resistors R23 and R24 are used to pass ESD test. The value of R23 and R24 should be over 20Ω and below 47Ω respectively because of the undershoot performance. The package of R23 and R24 should be at least 0805 and there isn't any trace under these two resistors.

 C_{AREF} is suggested to parallel with AREF resistor to keep the volt-second product threshold stable. And the recommended value of C_{AREF} is 100nF. The recommended value of C24 is 100nF.

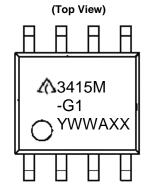

Ordering Information

Package	Temperature Range	Part Number	Marking ID	Packing	
SO-8	-40 to +85°C	APR3415MTR-G1	3415M-G1	4000/Tape & Reel	

Marking Information

First and Second Lines: Logo and Marking ID

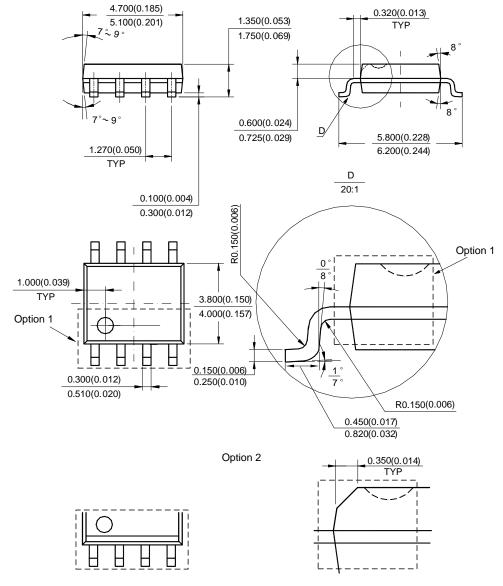

Third Line: Date Code

Y: Year

WW: Work Week of Molding
A: Assembly House Code
XX: 7th and 8th Digits of Batch No.

Package Outline Dimensions (All dimensions in mm(inch).)

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

- A. Life support devices or systems are devices or systems which:
 - 1. are intended to implant into the body, or
 - 2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.
- B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
