## **READ MODE**

The DS1220AB and DS1220AD execute a read cycle whenever  $\overline{WE}$  (Write Enable) is inactive (high) and  $\overline{CE}$  (Chip Enable) and  $\overline{OE}$  (Output Enable) are active (low). The unique address specified by the 11 address inputs (A0-A10) defines which of the 2048 bytes of data is to be accessed. Valid data will be available to the eight data output drivers within t<sub>ACC</sub> (Access Time) after the last address input signal is stable, providing that the  $\overline{CE}$  and  $\overline{OE}$  access times are also satisfied. If  $\overline{CE}$  and  $\overline{OE}$  access times are not satisfied, then data access must be measured from the later-occurring signal and the limiting parameter is either t<sub>CO</sub> for  $\overline{CE}$  or t<sub>OE</sub> for  $\overline{OE}$  rather than address access.

## WRITE MODE

The DS1220AB and DS1220AD execute a write cycle whenever the  $\overline{WE}$  and  $\overline{CE}$  signals are active (low) after address inputs are stable. The latter occurring falling edge of  $\overline{CE}$  or  $\overline{WE}$  will determine the start of the write cycle. The write cycle is terminated by the earlier rising edge of  $\overline{CE}$  or  $\overline{WE}$ . All address inputs must be kept valid throughout the write cycle. WE must return to the high state for a minimum recovery time (t<sub>WR</sub>) before another cycle can be initiated. The  $\overline{OE}$  control signal should be kept inactive (high) during write cycles to avoid bus contention. However, if the output drivers are enabled ( $\overline{CE}$  and  $\overline{OE}$  active) then  $\overline{WE}$  will disable the outputs in t<sub>ODW</sub> from its falling edge.

## DATA RETENTION MODE

The DS1220AB provides full functional capability for  $V_{CC}$  greater than 4.75 volts and write protects by 4.5V. The DS1220AD provides full functional capability for  $V_{CC}$  greater than 4.5 volts and write protects by 4.25V. Data is maintained in the absence of  $V_{CC}$  without any additional support circuitry. The nonvolatile static RAMs constantly monitor  $V_{CC}$ . Should the supply voltage decay, the NV SRAMs automatically write protect themselves, all inputs become "don't care," and all outputs become high impedance. As  $V_{CC}$  falls below approximately 3.0 volts, a power switching circuit connects the lithium energy source to RAM to retain data. During power-up, when  $V_{CC}$  rises above approximately 3.0 volts, the power switching circuit connects external  $V_{CC}$  to RAM and disconnects the lithium energy source. Normal RAM operation can resume after  $V_{CC}$  exceeds 4.75 volts for the DS1220AB and 4.5 volts for the DS1220AD.

## FRESHNESS SEAL

Each DS1220 device is shipped from Dallas Semiconductor with its lithium energy source disconnected, guaranteeing full energy capacity. When  $V_{CC}$  is first applied at a level of greater than  $V_{TP}$ , the lithium energy source is enabled for battery backup operation.

## **ABSOLUTE MAXIMUM RATINGS\***

Voltage on Any Pin Relative to Ground **Operating Temperature** Storage Temperature Soldering Temperature Caution: Do Not Reflow

-0.3V to +6.0V  $0^{\circ}$ C to  $70^{\circ}$ C;  $-40^{\circ}$ C to  $+85^{\circ}$ C for IND parts  $-40^{\circ}$ C to  $+70^{\circ}$ C;  $-40^{\circ}$ C to  $+85^{\circ}$ C for IND parts +260°C for 10 seconds (Wave or Hand Solder Only)

\* This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

#### WARNING:

Under no circumstances are negative undershoots, of any amplitude, allowed when device is in the battery backup mode.

### NOTES:

- 1. WE is high for a read cycle.
- 2.  $\overline{OE} = V_{IH}$  or  $V_{IL}$ . If  $\overline{OE} = V_{IH}$  during write cycle, the output buffers remain in a high-impedance state.
- 3. t<sub>WP</sub> is specified as the logical AND of  $\overline{CE}$  and  $\overline{WE}$ . t<sub>WP</sub> is measured from the latter of  $\overline{CE}$  or  $\overline{CE}$  going low to the earlier of  $\overline{CE}$  or  $\overline{WE}$  going high.
- 4.  $t_{DS}$  is measured from the earlier of  $\overline{CE}$  or  $\overline{WE}$  going high.
- 5. These parameters are sampled with a 5 pF load and are not 100% tested.
- 6. If the CE low transition occurs simultaneously with or later than the WE low transition, the output buffers remain in a high-impedance state during this period.
- 7. If the  $\overline{CE}$  high transition occurs prior to or simultaneously with the  $\overline{WE}$  high transition, the output buffers remain in a high-impedance state during this period.

- 8. If  $\overline{WE}$  is low or the  $\overline{WE}$  low transition occurs prior to or simultaneously with the  $\overline{CE}$  low transition, the output buffers remain in a high-impedance state during this period.
- 9. Each DS1220AB and each DS1220AD has a built-in switch that disconnects the lithium source until  $V_{CC}$  is first applied by the user. The expected  $t_{DR}$  is defined as accumulative time in the absence of  $V_{CC}$  starting from the time power is first applied by the user. This parameter is guaranteed by design and is not 100% tested.
- 10. All AC and DC electrical characteristics are valid over the full operating temperature range. For commercial products, this range is 0°C to 70°C. For industrial products (IND), this range is -40°C to +85°C.
- 11. In a power down condition the voltage on any pin may not exceed the voltage on  $V_{CC}$ .
- 12.  $t_{WR1}$ ,  $t_{DH1}$  are measured from WE going high.
- 13.  $t_{WR2}$ ,  $t_{DH2}$  are measured from CE going high.
- 14. DS1220 modules are recognized by Underwriters Laboratory (U.L.®) under file E99151.
