Notes:

1. *The eight switches operate independently.*
2. *Serial data is clocked in on the L to H transition of the CLK.*
3. *The switches go to a state retaining their present condition at the rising edge of $\overline{LE}$. When $\overline{LE}$ is low the shift register data flow through the latch.*
4. *D_{OUT} is high when data in the shift register 7 is high.*
5. *Shift register clocking has no effect on the switch states if $\overline{LE}$ is high.*
6. *The CLR clear input overrides all other inputs.*
