TYPICAL PERFORMANCE CHARACTERISTICS

PIN FUNCTIONS (ThinSOT/SC70/DFN Packages)

SW (Pin 1/Pin 1/Pin 3): Switch Pin. Connect inductor/diode here. Minimize trace at this pin to reduce EMI.

GND (Pin 2/Pins 2 and 5/Exposed Pad Pin 7): Ground Pin. Tie directly to local ground plane.

FB (Pin 3/Pin 3/Pin 1): Feedback Pin. Reference voltage is 1.255V. Connect resistor divider tap here. Minimize trace area at FB. Set V_{OUT} according to $V_{OUT} = 1.255V (1 + R1/R2)$.

SHDN (Pin 4/Pin 4/Pin 6): Shutdown Pin. Tie to 1.5V or higher to enable device; 0.4V or less to disable device. Also functions as soft-start. Use RC filter (47k, 47nF typ) as shown in Figure 1.

V_{IN} (Pin 5/Pin 6/Pin 4): Input Supply Pin. Must be locally bypassed.

NC (NA/NA/Pins 2, 5): No-Connects. These pins are not connected to internal circuitry. They should be tied to ground to improve thermal and electrical performance.

BLOCK DIAGRAM

Figure 1. Block Diagram, LT3460

OPERATION

The LT3460/LT3460-1 uses a constant frequency, current mode control scheme to provide excellent line and load regulation. Operation can be best understood by referring to the block diagram in Figure 1. At the start of each oscillator cycle, the SR latch is set, which turns on the power switch Q1. A voltage proportional to the switch current is added to a stabilizing ramp and the resulting sum is fed into the positive terminal of the PWM comparator A2. When this voltage exceeds the level at the negative input of A2, the SR latch is reset turning off the power switch. The level at the negative input of A2 is set by the error amplifier A1, and is simply an amplified version of the difference between the feedback voltage and the reference voltage of 1.255V. In this manner, the error amplifier sets the correct peak current level to keep the output in regulation. If the error amplifier's output increases, more current is delivered to the output; if it decreases, less current is delivered.

Feedback Loop Compensation

The LT3460/LT3460-1 has an internal feedback compensation network as shown in Figure 1 (R_C and C_C). However, because the small signal characteristics of a boost converter change with operation conditions, the internal compensation network cannot satisfy all applications. A properly designed external feed forward capacitor from V_{OUT} to

FB (C_F in Figure 2) will correct the loop compensation for most applications.

The LT3460/LT3460-1 uses peak current mode control. The current feedback makes the inductor very similar to a current source in the medium frequency range. The power stage transfer function in the medium frequency range can be approximated as:

$$G_{P(s)} = \frac{K1}{s \cdot C2},$$

where $C2$ is the output capacitance, and $K1$ is a constant based on the operating point of the converter. In continuous current mode, $K1$ increases as the duty cycle decreases.

The internal compensation network R_C , C_C can be approximated as follows in medium frequency range:

$$G_{C(s)} = K2 \cdot \frac{s \cdot R_C \cdot C_C + 1}{s \cdot C_C}$$

The zero

$$f_z = \frac{1}{2 \cdot \pi \cdot R_C \cdot C_C}$$

is about 70kHz.

OPERATION

Figure 2. 5V to 12V Step-Up Converter

The feedback loop gain $T(s) = K3 \cdot G_P(s) \cdot G_C(s)$. If it crosses over 0dB far before f_z , the phase margin will be small. Figure 3 is the Bode plot of the feedback loop gain measured from the converter shown in Figure 2 without the feedforward capacitor C_F . The result agrees with the previous discussion: Phase margin of about 20° is insufficient.

In order to improve the phase margin, a feed-forward capacitor C_F in Figure 2 can be used.

Without the feed-forward capacitor, the transfer function from V_{OUT} to FB is:

$$\frac{FB}{V_{OUT}} = \frac{R1}{R1+R2}$$

With the feed-forward capacitor C_F , the transfer function becomes:

$$\frac{FB}{V_{OUT}} = \frac{R1}{R1+R2} \cdot \frac{s \cdot R2 \cdot C_F + 1}{s \cdot \frac{R1 \cdot R2}{R1+R2} \cdot C_F + 1}$$

The feed-forward capacitor C_F generates a zero and a pole. The zero always appears before the pole. The frequency distance between the zero and the pole is determined only by the ratio between V_{OUT} and FB. To give maximum phase margin, C_F should be chosen so that the midpoint frequency between the zero and the pole is at the cross over frequency.

With $C_F = 20pF$, the feedback loop Bode plot is reshaped as shown in Figure 4. The phase margin is about 60° .

Figure 3

Figure 4

The feed-forward capacitor increases the gain at high frequency. The feedback loop therefore needs to have enough attenuation at the switching frequency to reject the switching noise. Additional internal compensation components have taken this into consideration.

For most of the applications of LT3460/LT3460-1, the output capacitor ESR zero is at very high frequency and can be ignored. If a low frequency ESR zero exists, for example, when a high-ESR Tantalum capacitor is used at the output, the phase margin may be enough even without a feed-forward capacitor. In these cases, the feed-forward capacitor should not be added because it may cause the feedback loop to not have enough attenuation at the switching frequency.

OPERATION

Layout Hints

The high speed operation of the LT3460/LT3460-1 demands careful attention to board layout. You will not get advertised performance with careless layout. Figure 5 shows the recommended component placement.

PACKAGE DESCRIPTION

S5 Package 5-Lead Plastic TSOT-23 (Reference LTC DWG # 05-08-1635)

PACKAGE DESCRIPTION

SC6 Package 6-Lead Plastic SC70 (Reference LTC DWG # 05-08-1638)

- NOTE:
1. DIMENSIONS ARE IN MILLIMETERS
 2. DRAWING NOT TO SCALE
 3. DIMENSIONS ARE INCLUSIVE OF PLATING
 4. DIMENSIONS ARE EXCLUSIVE OF MOLD FLASH AND METAL BURR
 5. MOLD FLASH SHALL NOT EXCEED 0.254mm
 6. DETAILS OF THE PIN 1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN THE INDEX AREA
 7. EIAJ PACKAGE REFERENCE IS EIAJ SC-70

DC Package 6-Lead Plastic DFN (2mm × 2mm) (Reference LTC DWG # 05-08-1703)

- NOTE:
1. DRAWING TO BE MADE A JEDEC PACKAGE OUTLINE M0-229 VARIATION OF (WCCD-2)
 2. DRAWING NOT TO SCALE
 3. ALL DIMENSIONS ARE IN MILLIMETERS
 4. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE MOLD FLASH. MOLD FLASH, IF PRESENT, SHALL NOT EXCEED 0.15mm ON ANY SIDE
 5. EXPOSED PAD SHALL BE SOLDER PLATED
 6. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION ON THE TOP AND BOTTOM OF PACKAGE
