## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings<sup>(†)</sup>

|                                                     |                                 |
|-----------------------------------------------------|---------------------------------|
| V <sub>CC</sub> .....                               | 7.0V                            |
| All inputs and outputs w.r.t. V <sub>SS</sub> ..... | -0.6V to V <sub>CC</sub> + 1.0V |
| Storage temperature .....                           | -65°C to 150°C                  |
| Ambient temperature under bias .....                | -40°C to 125°C                  |
| ESD protection on all pins .....                    | 4 kV                            |

† NOTICE: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for an extended period of time may affect device reliability.

TABLE 1-1: DC CHARACTERISTICS

### 2.1 Chip Select ( $\overline{\text{CS}}$ )

A low level on this pin selects the device. A high level deselects the device and forces it into Standby mode. However, a programming cycle which is already initiated or in progress will be completed, regardless of the  $\overline{\text{CS}}$  input signal. If  $\overline{\text{CS}}$  is brought high during a program cycle, the device will go into Standby mode as soon as the programming cycle is complete. When the device is deselected, SO goes to the high-impedance state, allowing multiple parts to share the same SPI bus. A low-to-high transition on  $\overline{\text{CS}}$  after a valid write sequence initiates an internal write cycle. After power-up, a low level on  $\overline{\text{CS}}$  is required prior to any sequence being initiated.

### 2.2 Serial Output (SO)

The SO pin is used to transfer data out of the 25XX320. During a read cycle, data is shifted out on this pin after the falling edge of the serial clock.

### 2.3 Write-Protect ( $\overline{\text{WP}}$ )

This pin is used in conjunction with the WPEN bit in the STATUS register to prohibit writes to the nonvolatile bits in the STATUS register. When  $\overline{\text{WP}}$  is low and WPEN is high, writing to the nonvolatile bits in the STATUS register is disabled. All other operations function normally. When  $\overline{\text{WP}}$  is high, all functions, including writes to the nonvolatile bits in the STATUS register operate normally. If the WPEN bit is set,  $\overline{\text{WP}}$  low during a STATUS register write sequence will disable writing to the STATUS register. If an internal write cycle has already begun,  $\overline{\text{WP}}$  going low will have no effect on the write.

The  $\overline{\text{WP}}$  pin function is blocked when the WPEN bit in the STATUS register is low. This allows the user to install the 25XX320 in a system with  $\overline{\text{WP}}$  pin grounded and still be able to write to the STATUS register. The  $\overline{\text{WP}}$  pin functions will be enabled when the WPEN bit is set high.

### 2.4 Serial Input (SI)

The SI pin is used to transfer data into the device. It receives instructions, addresses, and data. Data is latched on the rising edge of the serial clock.

### 2.5 Serial Clock (SCK)

The SCK is used to synchronize the communication between a master and the 25XX320. Instructions, addresses, or data present on the SI pin are latched on the rising edge of the clock input, while data on the SO pin is updated after the falling edge of the clock input.

### 2.6 Hold ( $\overline{\text{HOLD}}$ )

The  $\overline{\text{HOLD}}$  pin is used to suspend transmission to the 25XX320 while in the middle of a serial sequence without having to re-transmit the entire sequence again. It must be held high any time this function is not being used. Once the device is selected and a serial sequence is underway, the  $\overline{\text{HOLD}}$  pin may be pulled low to pause further serial communication without resetting the serial sequence. The  $\overline{\text{HOLD}}$  pin must be brought low while SCK is low, otherwise the HOLD function will not be invoked until the next SCK high-to-low transition. The 25XX320 must remain selected during this sequence. The SI, SCK, and SO pins are in a high-impedance state during the time the device is paused and transitions on these pins will be ignored. To resume serial communication,  $\overline{\text{HOLD}}$  must be brought high while the SCK pin is low, otherwise serial communication will not resume. Lowering the HOLD line at any time will tri-state the SO line.

## 3.0 FUNCTIONAL DESCRIPTION

### 3.1 Principles Of Operation

The 25XX320 are 4096 byte Serial EEPROMs designed to interface directly with the Serial Peripheral Interface (SPI) port of many of today's popular microcontroller families, including Microchip's PIC16C6X/7X microcontrollers. It may also interface with microcontrollers that do not have a built-in SPI port by using discrete I/O lines programmed properly with the software.

The 25XX320 contains an 8-bit instruction register. The device is accessed via the SI pin, with data being clocked in on the rising edge of SCK. The  $\overline{\text{CS}}$  pin must be low and the  $\overline{\text{HOLD}}$  pin must be high for the entire operation.

Table 3-1 contains a list of the possible instruction bytes and format for device operation. All instructions, addresses and data are transferred MSB first, LSB last.

Data is sampled on the first rising edge of SCK after  $\overline{\text{CS}}$  goes low. If the clock line is shared with other peripheral devices on the SPI bus, the user can assert the  $\overline{\text{HOLD}}$  input and place the 25XX320 in 'HOLD' mode. After releasing the  $\overline{\text{HOLD}}$  pin, operation will resume from the point when the  $\overline{\text{HOLD}}$  was asserted.

### 3.2 Read Sequence

The device is selected by pulling  $\overline{\text{CS}}$  low. The 8-bit READ instruction is transmitted to the 25XX320 followed by the 16-bit address, with the four MSBs of the address being "don't care" bits. After the correct READ instruction and address are sent, the data stored in the memory at the selected address is shifted out on the SO pin. The data stored in the memory at the next address can be read sequentially by continuing to provide clock pulses. The internal Address Pointer is automatically incremented to the next higher address after each byte of data is shifted out. When the highest address is reached (0FFFh), the address counter rolls over to address 0000h allowing the read cycle to be continued indefinitely. The read operation is terminated by raising the  $\overline{\text{CS}}$  pin (Figure 3-1).

### 3.3 Write Sequence

Prior to any attempt to write data to the 25XX320, the write enable latch must be set by issuing the WREN instruction (Figure 3-4). This is done by setting  $\overline{\text{CS}}$  low and then clocking out the proper instruction into the 25XX320. After all eight bits of the instruction are transmitted, the  $\overline{\text{CS}}$  must be brought high to set the write enable latch. If the write operation is initiated immediately after the WREN instruction without  $\overline{\text{CS}}$  being brought high, the data will not be written to the array because the write enable latch will not have been properly set.

Once the write enable latch is set, the user may proceed by setting the  $\overline{\text{CS}}$  low, issuing a WRITE instruction, followed by the 16-bit address, with the four MSBs of the address being "don't care" bits, and then the data to be written. Up to 32 bytes of data can be sent to the 25XX320 before a write cycle is necessary. The only restriction is that all of the bytes must reside in the same page. A page address begins with xxxxx xxx0 0000 and ends with xxxxx xxx1 1111. If the internal address counter reaches xxxxx xxx1 1111 and the clock continues, the counter will roll back to the first address of the page and overwrite any data in the page that may have been written.

For the data to be actually written to the array, the  $\overline{\text{CS}}$  must be brought high after the Least Significant bit (D0) of the  $n^{\text{th}}$  data byte has been clocked in. If  $\overline{\text{CS}}$  is brought high at any other time, the write operation will not be completed. Refer to Figure 3-2 and Figure 3-3 for more detailed illustrations on the byte write sequence and the page write sequence, respectively. While the write is in progress, the STATUS register may be read to check the status of the WPEN, WIP, WEL, BP1 and BP0 bits (Figure 3-6). A read attempt of a memory array location will not be possible during a write cycle. When the write cycle is completed, the write enable latch is reset.

TABLE 3-1: INSTRUCTION SET

| Instruction Name | Instruction Format | Description                                               |
|------------------|--------------------|-----------------------------------------------------------|
| READ             | 0000 0011          | Read data from memory array beginning at selected address |
| WRITE            | 0000 0010          | Write data to memory array beginning at selected address  |
| WRDI             | 0000 0100          | Reset the write enable latch (disable write operations)   |
| WREN             | 0000 0110          | Set the write enable latch (enable write operations)      |
| RDSR             | 0000 0101          | Read STATUS register                                      |
| WRSR             | 0000 0001          | Write STATUS register                                     |

# 25AA320/25LC320/25C320

**FIGURE 3-1: READ SEQUENCE**

**FIGURE 3-2: BYTE WRITE SEQUENCE**

**FIGURE 3-3: PAGE WRITE SEQUENCE**

## 3.4 Write Enable (WREN) and Write Disable (WRDI)

The 25XX320 contains a write enable latch. See Table 3-3 for the Write-Protect Functionality Matrix. This latch must be set before any write operation will be completed internally. The WREN instruction will set the latch, and the WRDI will reset the latch.

The following is a list of conditions under which the write enable latch will be reset:

- Power-up
- WRDI instruction successfully executed
- WRSR instruction successfully executed
- WRITE instruction successfully executed

**FIGURE 3-4: WRITE ENABLE SEQUENCE**

**FIGURE 3-5: WRITE DISABLE SEQUENCE**

# 25AA320/25LC320/25C320

## 3.5 Read Status Register Instruction (RDSR)

The Read Status Register instruction (RDSR) provides access to the STATUS register. The STATUS register may be read at any time, even during a write cycle. The STATUS register is formatted as follows:

|      |   |   |   |     |     |     |     |
|------|---|---|---|-----|-----|-----|-----|
| 7    | 6 | 5 | 4 | 3   | 2   | 1   | 0   |
| WPEN | X | X | X | BP1 | BP0 | WEL | WIP |

The **Write-In-Process (WIP)** bit indicates whether the 25XX320 is busy with a write operation. When set to a '1', a write is in progress; when set to a '0', no write is in progress. This bit is read-only.

The **Write Enable Latch (WEL)** bit indicates the status of the write enable latch. When set to a '1', the latch allows writes to the array, when set to a '0', the latch prohibits writes to the array. The state of this bit can always be updated via the WREN or WRDI commands regardless of the state of write protection on the STATUS register. This bit is read-only.

The **Block Protection (BP0 and BP1)** bits indicate which blocks are currently write-protected. These bits are set by the user issuing the WRSR instruction. These bits are nonvolatile.

See Figure 3-6 for the RDSR timing sequence.

FIGURE 3-6: READ STATUS REGISTER TIMING SEQUENCE

## 3.6 Write Status Register Instruction (WRSR)

The Write Status Register instruction (WRSR) allows the user to select one of four levels of protection for the array by writing to the appropriate bits in the STATUS register. The array is divided up into four segments. The user has the ability to write-protect none, one, two, or all four of the segments of the array. The partitioning is controlled as shown in Table 3-2.

The Write-Protect Enable (WPEN) bit is a nonvolatile bit that is available as an enable bit for the  $\overline{WP}$  pin. The Write-Protect ( $\overline{WP}$ ) pin and the Write-Protect Enable (WPEN) bit in the STATUS register control the programmable hardware write-protect feature. Hardware write protection is enabled when  $\overline{WP}$  pin is low and the WPEN bit is high. Hardware write protection is disabled when either the  $\overline{WP}$  pin is high or the WPEN bit is low.

When the chip is hardware write-protected, only writes to nonvolatile bits in the STATUS register are disabled. See Table 3-3 for a matrix of functionality on the WPEN bit.

See Figure 3-7 for the WRSR timing sequence.

**TABLE 3-2: ARRAY PROTECTION**

| BP1 | BP0 | Array Addresses Write-Protected |
|-----|-----|---------------------------------|
| 0   | 0   | none                            |
| 0   | 1   | upper 1/4<br>(0C00h-0FFFh)      |
| 1   | 0   | upper 1/2<br>(0800h-0FFFh)      |
| 1   | 1   | all<br>(0000h-0FFFh)            |

**FIGURE 3-7: WRITE STATUS REGISTER TIMING SEQUENCE**

# 25AA320/25LC320/25C320

## 3.7 Data Protection

The following protection has been implemented to prevent inadvertent writes to the array:

- The write enable latch is reset on power-up
- A `WRITE ENABLE` instruction must be issued to set the write enable latch
- After a byte write, page write or STATUS register write, the write enable latch is reset
- $\overline{CS}$  must be set high after the proper number of clock cycles to start an internal write cycle
- Access to the array during an internal write cycle is ignored and programming is continued

## 3.8 Power-On State

The 25XX320 powers on in the following state:

- The device is in low-power Standby mode ( $\overline{CS} = 1$ )
- The write enable latch is reset
- SO is in high-impedance state
- A low level on  $\overline{CS}$  is required to enter active state

**TABLE 3-3: WRITE-PROTECT FUNCTIONALITY MATRIX**

| WPEN | $\overline{WP}$ | WEL | Protected Blocks | Unprotected Blocks | STATUS Register |
|------|-----------------|-----|------------------|--------------------|-----------------|
| x    | x               | 0   | Protected        | Protected          | Protected       |
| 0    | x               | 1   | Protected        | Writable           | Writable        |
| 1    | Low             | 1   | Protected        | Writable           | Protected       |
| x    | High            | 1   | Protected        | Writable           | Writable        |

|                | NNN    | Alphanumeric traceability code                                                                                   |
|                | (e3)   | Pb-free JEDEC designator for Matte Tin (Sn)                                                                      |
|                | *      | This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package. |

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

- \* Standard marking consists of Microchip part number, year code, week code, and traceability code. For device markings beyond this, certain price adders apply. Please check with your Microchip Sales Office. For QTP devices, any special marking adders are included in QTP price.

Microchip Technology Drawing C04-087B

## APPENDIX A: REVISION HISTORY

### Revision D

Corrections to Section 1.0, Electrical Characteristics.

### Revision E

Revise Endurance from 100K to 1M.

### Revision F (June 2008)

Added "Not Recommended" note; Updated Packaging;  
General updates.

# 25AA320/25LC320/25C320

---

NOTES:

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com), click on Customer Change Notification and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: <http://support.microchip.com>**

## READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

To: Technical Publications Manager  
RE: Reader Response  
From: Name \_\_\_\_\_  
Company \_\_\_\_\_  
Address \_\_\_\_\_  
City / State / ZIP / Country \_\_\_\_\_  
Telephone: (\_\_\_\_) \_\_\_\_\_ - \_\_\_\_\_ FAX: (\_\_\_\_) \_\_\_\_\_ - \_\_\_\_\_

Application (optional):

Would you like a reply? \_\_\_Y \_\_\_N

Device: 25AA320/25LC320/25C320 Literature Number: DS21227F

Questions:

1. What are the best features of this document?

---

---

2. How does this document meet your hardware and software development needs?

---

---

3. Do you find the organization of this document easy to follow? If not, why?

---

---

4. What additions to the document do you think would enhance the structure and subject?

---

---

5. What deletions from the document could be made without affecting the overall usefulness?

---

---

6. Is there any incorrect or misleading information (what and where)?

---

---

7. How would you improve this document?

---

---

|                 | ST14                      | =                                                                         | Plastic TSSOP (4.4 mm body), 14-lead |            |

**Examples:**

- a) 25LC320-I/SN: Industrial Temp., SOIC package
- b) 25LC320T-I/SN: Tape and Reel, Industrial Temp., SOIC package
- c) 25LC320-E/SN: Extended Temp., SOIC package
- d) 25C320-I/SN: Industrial Temp., SOIC package
- e) 25C320T-I/SN: Tape and Reel, Industrial Temp., SOIC package
- f) 25C320-I/ST: Industrial Temp., TSSOP package
- g) 25C320-E/SN: Extended Temp., SOIC package

# 25AA320/25LC320/25C320

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM**  
**CERTIFIED BY DNV**  
**== ISO/TS 16949:2002 ==**

*Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
