Absolute Maximum Ratings (@T_A = +25°C, unless otherwise specified.)

Stresses greater than the 'Absolute Maximum Ratings' specified above, may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions exceeding those indicated in this specification is not implied. Device reliability may be affected by exposure to absolute maximum rating conditions for extended periods of time.

V_{SAT} = Saturation voltage of the output switch.
V_F = Forward voltage drop of the output rectifier.

The following power supply characteristics must be chosen:
V_{IN} - Nominal input voltage.
V_{OUT} - Desired output voltage, $|V_{OUT}| = 1.25 (1+R2/R1)$
I_{OUT} - Desired output current.
F_{MIN} - Minimum desired output switching frequency at the selected values of V_{IN} and I_O.
$V_{RIPPLE(pp)}$ - Desired peak-to-peak output ripple voltage. In practice, the calculated capacitor value will need to be increased due to its equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly affect the line and load regulation.
