Functional Description

The PALCE16V8 is executed in a 20-pin 300-mil molded DIP, a 300-mil cerdip, a 20-lead square ceramic leadless chip carrier, and a 20-lead square plastic leaded chip carrier.

The device provides up to 16 inputs and 8 outputs. The PALCE16V8 can be electrically erased and reprogrammed. The programmable macrocell enables the device to function as a superset to the familiar 20-pin PLDs such as 16L8, 16R8, 16R6, and 16R4.

The PALCE16V8 features 8 product terms per output and 32 input terms into the AND array. The first product term in a macrocell can be used either as an internal output enable control or as a data product term.

There are a total of 18 architecture bits in the PALCE16V8 macrocell; two are global bits that apply to all macrocells and 16 that apply locally, two bits per macrocell. The architecture bits determine whether the macrocell functions as a register or combinatorial with inverting or noninverting output. The output enable control can come from an external pin or internally from a product term. The output can also be permanently enabled, functioning as a dedicated output or permanently disabled, functioning as a dedicated input. Feedback paths are selectable from either the input/output pin associated with the

macrocell, the input/output pin associated with an adjacent pin, or from the macrocell register itself.

Power-Up Reset

All registers in the PALCE16V8 power-up to a logic LOW for predictable system initialization. For each register, the associated output pin will be HIGH due to active-LOW outputs.

Electronic Signature

An electronic signature word is provided in the PALCE16V8 that consists of 64 bits of programmable memory that can contain user-defined data.

Security Bit

A security bit is provided that defeats the readback of the internal programmed pattern when the bit is programmed.

Low Power

The Cypress PALCE16V8 provides low-power operation through the use of CMOS technology, and increased testability with Flash reprogrammability.

Product Term Disable

Product Term Disable (PTD) fuses are included for each product term. The PTD fuses allow each product term to be individually disabled.

Configuration Table

CG_0	CG_1	$CL0_x$	Cell Configuration	Devices Emulated
0	1	0	Registered Output	Registered Med PALs
0	1	1	Combinatorial I/O	Registered Med PALs
1	0	0	Combinatorial Output	Small PALs
1	0	1	Input	Small PALs
1	1	1	Combinatorial I/O	16L8 only

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature -65°C to +150°C

Ambient Temperature with
Power Applied -55°C to +125°C

Supply Voltage to Ground Potential
(Pin 24 to Pin 12) -0.5V to +7.0V

DC Voltage Applied to Outputs
in High-Z State -0.5V to +7.0V

DC Input Voltage -0.5V to +7.0V

Output Current into Outputs (LOW) 24 mA

DC Programming Voltage 12.5V

Latch-Up Current > 200 mA

Operating Range

Range	Ambient Temperature	V _{CC}
Commercial	0°C to +75°C	5V ±5%
Military ^[1]	-55°C to +125°C	5V ±10%
Industrial	-40°C to +85°C	5V ±10%

Electrical Characteristics Over the Operating Range^[2]

Parameter	Description	Test Conditions		Min.	Max.	Unit
V _{OH}	Output HIGH Voltage	V _{CC} = Min., V _{IN} = V _{IH} or V _{IL}	I _{OH} = -3.2 mA Com'l I _{OH} = -2 mA Mil/Ind	2.4		V

Capacitance^[7]

Parameter	Description	Test Conditions	Typ.	Unit
C _{IN}	Input Capacitance	V _{IN} = 2.0V @ f = 1 MHz	5	pF
C _{OUT}	Output Capacitance	V _{OUT} = 2.0V @ f = 1 MHz	5	pF

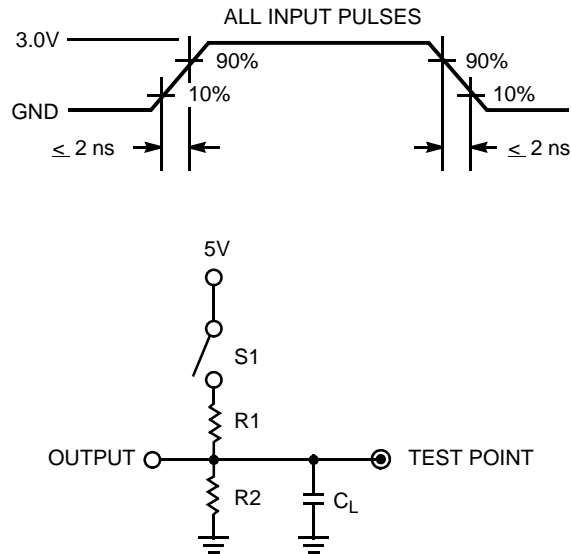

Endurance Characteristics^[7]

Parameter	Description	Test Conditions	Min.	Max.	Unit
N	Minimum Reprogramming Cycles	Normal Programming Conditions	100		Cycles

Notes:

1. T_A is the "instant on" case temperature.
2. See the last page of this specification for Group A subgroup testing information.
3. These are absolute values with respect to device ground. All overshoots due to system or tester noise are included.
4. V_{IL} (Min.) is equal to -3.0V for pulse durations less than 20 ns.
5. The leakage current is due to the internal pull-up resistor on all pins.
6. Not more than one output should be tested at a time. Duration of the short circuit should not be more than one second. V_{OUT} = 0.5V has been chosen to avoid test problems caused by tester ground degradation.
7. Tested initially and after any design or process changes that may affect these parameters.

Shaded areas contain preliminary information.

Notes:

8. Min. times are tested initially and after any design or process changes that may affect these parameters.
9. This specification is guaranteed for all device outputs changing state in a given access cycle.
10. This parameter is measured as the time after OE pin or internal disable input disables or enables the output pin. This delay is measured to the point at which a previous HIGH level has fallen to 0.5 volts below V_{OH} min. or a previous LOW level has risen to 0.5 volts above V_{OL} max.
11. This specification indicates the guaranteed maximum frequency at which a state machine configuration with external feedback can operate.
12. This specification indicates the guaranteed maximum frequency at which the device can operate in data path mode.
13. This specification indicates the guaranteed maximum frequency at which a state machine configuration with internal only feedback can operate.
14. This parameter is calculated from the clock period at f_{MAX} internal (1/f_{MAX3}) as measured (see Note 7 above) minus t_S.
