

**Applications**

- 10 Gigabit line cards
- Synchronous Ethernet, 10 GBASE-R and 10 GBASE-W
- OTN multiplexers and transponders
- SONET/SDH, Fibre Channel, XAUI

## Change Summary

Below are the changes from the June 2012 issue to the March 2015 issue

Page	Item	Change
1	Ordering Information	Removed ZL30157GGG (leaded version) from the ordering information
1	Added Features bullet	Included availability of customer defined default configurations
16, 33, 33	Updated section 4.0, 5.0 and added 5.1	Updated to include the availability of Custom OTP configuration
149	13.0, "Package Markings"	Added section 13.0 for package markings

Below are the changes from the January 2012 issue to the June 2012 issue

Page	Item	Change
140	Input to Output alignment	Added min/max values for $t_{HP\_REFD}$
142	Output to Output Alignment	Added min/max values for $t_{OUT2OUTD}$
54 and 124	Register 0xC6 - Chip_Revision_2	Updated chip_revision_2 register 0xC6 = 0x03

Below are the changes from the December 2011 issue to the January 2012 issue

Page	Item	Change
47	Procedure for writing registers	Added a new procedure for updating registers
48	Time between two write accesses to the same register	Added register 0x0D to registers not requiring wait period
48	Sticky Read Registers	Updated procedure
54, 124	Register 0xC6	Added chip_revision_2 register
56	Register 0x00	updated chip_revision bits
62	Register 0x0D	updated Sticky_r_lock bit description

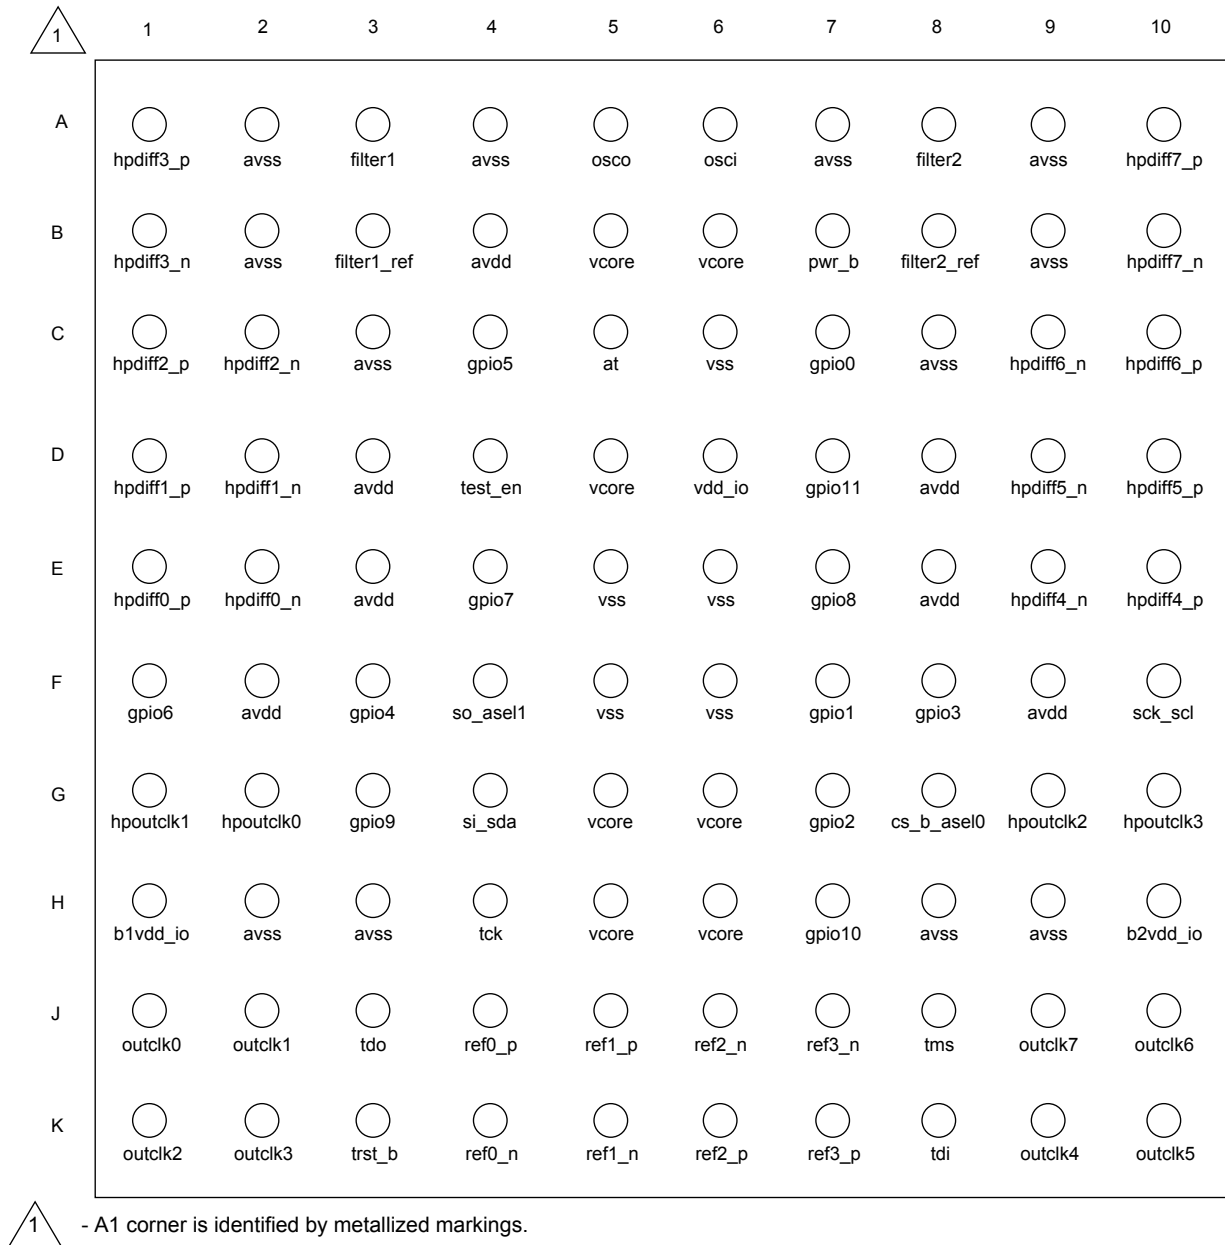

Below are the changes from the March 2011 issue to the December 2011 issue

Page	Item	Change
1	Features	<ul style="list-style-type: none"> <li>Output frequency is changed from "1 kHz to 720MHz" to "1kHz to 750MHz"</li> <li>Input frequency is changed from "1 kHz to 720MHz" to "1kHz to 750MHz"</li> <li>Corrected package description in ordering information to LBGA</li> </ul>
11	Pin description	<ul style="list-style-type: none"> <li>Maximum frequency limit on differential outputs is changed from " 720MHz" to "750MHz"</li> <li>Maximum frequency limit on differential inputs is changed from " 720MHz" to "750MHz"</li> <li>Name of Ball B1 is changed from hpdif3_n to hpdif3_n</li> <li>Name of Ball B10 is changed from hpdif7_n to hpdif7_n</li> </ul>
16	Input Sources	Maximum frequency limit on differential inputs is changed from " 720MHz" to "750MHz"
21	Divider and skew management	Maximum frequency limit on differential outputs is changed from " 720MHz" to "750MHz"
23	Output drivers	Maximum speed of differential outputs is changed from " 720MHz" to "750MHz"
27	Input Buffers	Input frequency range for differential inputs is changed from "1kHz to 720MHz" to "1kHz to 750MHz"
37	DPLL0 Lock Indication 2	"1us during 10s period" lock condition is changed to "10us during 1s period" .
40	Un-managed mode	LOS detected a failure and RefSwMask<0> is at logic "1" is changed to LOS detected a failure and HOMask<0> is at logic "1"
41	Managed Mode	LOS detected a failure and RefSwMask<0> is at logic "1" is changed to LOS detected a failure and HOMask<0> is at logic "1"
48	Reading from Sticky Read registers	Updated Sticky read procedure
48	Time between two write accesses to the same register	Changed wait time from 5ms to 12ms
49	Table 7	Heading of first column is changed from "Page_Addr" to "Reg_Addr"
49	Table 7	<ul style="list-style-type: none"> <li>Default value for register 0x70 is changed from 0xE4 to 0x10</li> <li>Default value for register 0x71 is changed from 0x03 to 0x01</li> </ul>
96	Detailed Register Map	Errors of bit mappig and default values for register 0x70 and 0x71 are corrected, new description of those two registers reflect the correct default configuration of ZL30157

Page	Item	Change
56	Detailed Register Map	"Page_Address" is changed to "Register_Address" for registers which addresses are from 0x80 to 0x85
56	Register 0x00 - id_reg	Updated ready_indication bit description
74	Register 0x33	Updated bit description of bits[7:6]
79	Register 0x38	Updated bit description of bits[7:6]
86	Register 0x4C	000 = +/- 0.1% (in Ref0 frequency units) changed to 000 = +/- 0.1% (in Ref1 frequency units)
87	Register 0x4D	000 = +/- 0.1% (in Ref0 frequency units) changed to 000 = +/- 0.1% (in Ref2 frequency units)
89	Register 0x4E	000 = +/- 0.1% (in Ref0 frequency units) changed to 000 = +/- 0.1% (in Re2 frequency units)
101	Register synth0_post_div_C	Bit[15:0]: note added for odd post divider
103	Register synth0_post_div_D	Bit[15:0]: note added for odd post divider
110	Register synth1_post_div_C	Bit[15:0]: note added for odd post divider
112	Register synth1_post_div_D	Bit[15:0]: note added for odd post divider
119	Register 0xB7	Bits [3:2] - changed outclk2 to outclk1 Bits [5:4] - changed outclk3 to outclk2
133	Register 0xF7	Updated spurs_suppression bit description
138	DC Electrical Characteristics - High Performance Outputs	Note added for differential output voltage when differential frequency is higher than 720MHz
140	AC Electrical Characteristics* - Inputs	Maximum frequency of differential inputs is changed from " 720MHz" to "750MHz"
142	AC Electrical Characteristics* - Outputs	Maximum frequency of differential outputs is changed from " 720MHz" to "750MHz"
146	Output Clocks Jitter Generation	Jitter measurement filter for 77.76MHz is changed from "12kHz-5MHz" to "12kHz-20MHz"
148	Section 12.0	Replaced drawing to reflect correct package description
135	DC Electrical Characteristics	All "AV <sub>DD-IO</sub> " symbols are replaced with "AV <sub>DD</sub> "

## 1.0 Pin Diagram

**Table 1 - Pin Description**

Ball #	Name	I/O	Description
<b>Control and Status</b>			
B7	pwr_b	I	<b>Power-on Reset.</b> A logic low at this input resets the device. To ensure proper operation, the device must be reset after power-up. The pwr_b pin should be held low for 2 ms. This pin is internally pulled-up to V <sub>DD</sub> . <b>User can access device registers either 50 ms after pwr_b goes high, or after bit 7 in register at address 0x00 goes high which can be determined by polling the register at address 0x00.</b>
C7 F7 G7 F8 F3 C4 F1 E4 E7 G3 H7 D7	gpio0 gpio1 gpio2 gpio3 gpio4 gpio5 gpio6 gpio7 gpio8 gpio9 gpio10 gpio11	I/O	<p><b>General Purpose Input and Output pins.</b> These are general purpose pins managed by the internal processor based on device configuration. Recommended usage of GPIO include:</p> <ul style="list-style-type: none"> <li>• DPLL lock indicators</li> <li>• DPLL holdover indicators</li> <li>• Reference fail indicators</li> <li>• Reference select control or monitor</li> <li>• Differential output clock enable (per output or as a bank of 2 or 4 outputs)</li> <li>• High performance LVCMOS outputs enable</li> <li>• Host Interrupt Output: flags changes of device status prompting the processor to read the enabled interrupt service registers (ISR).</li> </ul> <p>Pins 5:0 are internally pulled down to GND and pins 11:6 are internally pulled up to V<sub>DD</sub>.</p> <p>If not used GPIO can be kept unconnected.</p> <p><b>After power on reset, device GPIO[0,1,3,4,5] configure some of device basic functions, GPIO[3] set I2C or SPI control mode, GPIO[1,0] set master clock rate selection. The GPIO[0,1,3] pins must be either pulled low or high with an external 1 K<math>\Omega</math> resistor as needed for their assigned functions at reset; or they must be driven low or high for 50 ms after reset, and released and used for normal GPIO functions.</b></p> <p><b>The GPIO[4,5] pins must be either pulled low with external 1 K<math>\Omega</math> resistors; or they must be driven low for 50 ms after reset, and then released and used for normal GPIO functions.</b></p>
<b>Host Interface</b>			
F10	sck_scl	I/O	<b>Clock for Serial Interface.</b> Provides clock for serial micro-port interface. This pin is also the serial clock line (SCL) when the host interface is configured for I2C mode. As an input this pin is internally pulled up to V <sub>DD</sub> .
G4	si_sda	I/O	<b>Serial Interface Input.</b> Serial interface input stream. The serial data stream holds the access command, the address and the write data bits. This pin is also the serial data line (SDA) when host interface is configured for I2C mode. This pin is internally pulled up to V <sub>DD</sub> .
F4	so_asel1	I/O	<b>Serial Interface Output.</b> Serial interface output stream. As an output the serial stream holds the read data bits. This pin is also the I2C address select when host interface is configured for I2C mode.

Table 1 - Pin Description (continued)

Ball #	Name	I/O	Description
G8	cs_b_ase10	I	<b>Chip Select for Serial Interface.</b> Serial interface chip select, this is an active low signal. This pin is also the I2C address select when host interface is configured for I2C mode. This pin is internally pulled up to $V_{DD}$ .
<b>APLL Loop Filter</b>			
A3	filter1	A	<b>External Analog PLL1 Loop Filter terminal.</b>
B3	filter1_ref	A	<b>Analog PLL1 External Loop Filter Reference.</b>
A8	filter2	A	<b>External Analog PLL2 Loop Filter terminal.</b>
B8	filter2_ref	A	<b>Analog PLL2 External Loop Filter Reference.</b>
<b>JTAG (IEEE 1149.1) and Test</b>			
D4	test_en	I	<b>Test Mode Enable.</b> A logic high at this pin enables device test modes. This pin is internally pulled down to GND. Connect this pin to GND.
C5	at	A-I/O	<b>Analog PLL Test.</b> Test pin for analog PLL. Leave unconnected.
J3	tdo	O	<b>Test Serial Data Out.</b> JTAG serial data is output on this pin on the falling edge of tck. This pin is held in high impedance state when JTAG scan is not enabled.
K8	tdi	I	<b>Test Serial Data In.</b> JTAG serial test instructions and data are shifted in on this pin. This pin is internally pulled up to $V_{DD}$ . If this pin is not used then it should be left unconnected.
K3	trst_b	I	<b>Test Reset.</b> Asynchronously initializes the JTAG TAP controller by putting it in the Test-Logic-Reset state. This pin should be pulsed low on power-up to ensure that the device is in the normal functional state. This pin is internally pulled up to $V_{DD}$ . If this pin is not used then it should be connected to GND.
H4	tck	I	<b>Test Clock.</b> Provides the clock to the JTAG test logic. This pin is internally pulled up to $V_{DD}$ . If this pin is not used then it should be connected to GND.
J8	tms	I	<b>Test Mode Select.</b> JTAG signal that controls the state transitions of the TAP controller. This pin is internally pulled up to $V_{DD}$ . If this pin is not used then it should be left unconnected.
<b>Master Clock</b>			
A5	osco	A-O	<b>Oscillator Master Clock.</b> For crystal operation, a crystal is connected from this pin to osci. Not suitable for driving other devices. For clock oscillator operation, this pin is left unconnected.
A6	osci	I	<b>Oscillator Master Clock.</b> For crystal operation, a crystal is connected from this pin to osco. For clock oscillator operation, this pin is connected to a clock source.
<b>Power and Ground</b>			
D6	$V_{DD-IO}$		<b>Positive Supply Voltage IO.</b> +3.3 $V_{DC}$ nominal.
H1	B1 $V_{DD-IO}$		<b>Bank 1 Positive Supply Voltage IO.</b> Output group specific +3.3/2.5/1.8/1.5 $V_{DC}$ nominal.

Table 1 - Pin Description (continued)

### 3.0 Application Example

Synchronous Optical Ethernet ports supporting 10GBASE-R often require multiple frequency translation paths to synchronize the optical port with the system backplane; and to translate the receive line clock rate to the system backplane clock rate for use in system synchronization. Figure 3 illustrates how a single ZL30157 efficiently handles all synchronization and clock rate translations required for a synchronous 10 GBASE-R port.

ZL30157 in Figure 3 is configured with one DPLL that selects between two 19.44 MHz backplane clocks; both backplane clocks can be monitored for impairments and automatic reference switching state machine can switch from a failed reference to a good reference without causing bit errors in the transmission channel. PLL 0 uses precision clock generators to generate three copies of a low jitter 156.25 MHz clock to time XAUI bus and to time 10 GBASE-R transmit clock. PLL1 uses the general purpose clock generators to generate two copies of a 19.44 MHz clock synchronized to the receive line clock; the receive line clock rate will be typically 161.13 MHz. The clock rate translation from 161.13 MHz to 19.44 MHz involves a double translation which is accomplished via the two stage PLL architecture of the ZL30157.

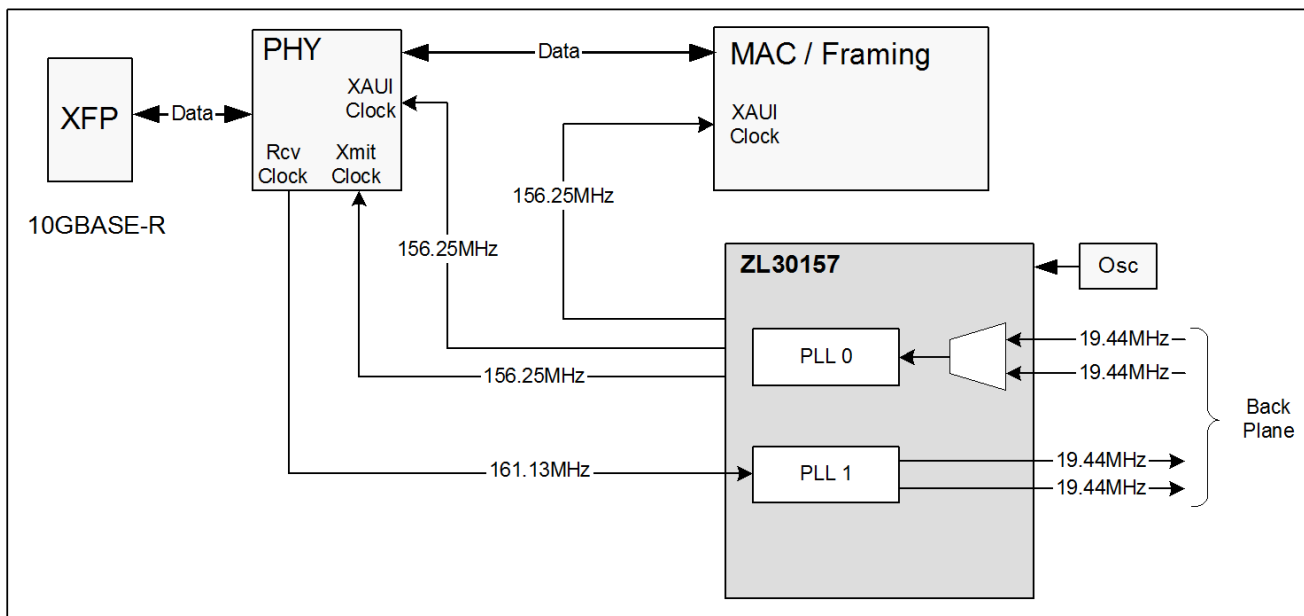

Figure 3 - Application Diagram: Frequency Translation for 10 GBASE-R Synchronous Ethernet

## 4.0 Functional Description

The functional block diagram of the device is shown in Figure 1. The ZL30157 is a Two Channel Universal Clock Translator that can be configured by any of the following methods; power-up with its default configuration; power-up with a custom OTP (One Time Programmable) configuration; after power-up it can be dynamically configured via the SPI/I2C port. Configurations set via the SPI/I2C are volatile and will need to be rewritten if the device is reset or powered-down. The SPI/I2C port is also used to access the status registers. The ZL30157's detailed operation is described in the following sections.

### 4.1 Input Sources

The device has 5 input sources: 4 input references (single ended or differential) and one oscillator clock source (oscillator or xtal).

The device master clock frequency is configured on reset via external voltage levels on GPIO[1:0] pins. The recommended frequency of the master clock is 24.576 MHz.

The device synchronizes (locks) to any input reference which is a 1 kHz multiple, or it synchronizes (locks) to any input reference which is an  $(M/N \times 1 \text{ kHz})$  multiple (FEC rate converted) where M and N are 16 bits wide.

The device input reference frequency is programmed during initialization, change of input reference frequency can be supported if DPLL was forced in to Holdover mode before a frequency change. Automatic detection of input reference frequency is not supported.

The device accepts an input reference with maximum frequency of 177.5 MHz through single ended LVCMOS input (or 750 MHz frequency through differential inputs) and a minimum frequency of 1 kHz.

If the frequency of an input reference exceeds 400 MHz, the reference will need to be divided by 2 before being fed to DPLL. Division by 2 can be set by programming ref\_config register at address 0x0A.

### 4.2 Input Reference Monitoring

The input references are monitored by reference monitor schemes, independent for each reference. They indicate abnormal behavior of the reference signal, for example; drift from its nominal frequency or excessive jitter.

- **Loss of Signal Monitor (LOS):** LOS is an external signal, fed to one of ZL30157 GPIO pins. LOS is typically generated by a PHY device whose recovered clock is fed to one of ZL30157 reference inputs. PHY device will generate LOS signal when it cannot reliably extract the clock from the line. User can set one of GPIO pins as LOS input by programming corresponding GPIO register.
- **Coarse Frequency Monitor (CFM):** This circuit monitors the reference over a short time interval. It detects large frequency irregularities (larger than 0.1%).
- **Single Cycle Monitor (SCM):** This detector checks the period of a single clock cycle to detect large phase hits or the complete loss of the clock.
- **Guard Soak Timer (GST):** Timer associated with the CFM and SCM modules to disqualify the reference input signal (see Table 2)

The monitor failure indicators are flagged in the status registers and have associated mask bits, as follows:

- Reference Fail Mask: Ref0FailMask<3:0>, Ref1FailMask<3:0>, Ref2FailMask<3:0>, Ref3FailMask<3:0>: these mask bits masks the failure indicator on corresponding fail pins/bits.
- Reference Switching Mask for the current active (locked to) reference: RefSwMask<3:0> these mask bits masks the failure indicators that are used in the automatic reference switching state machine independently for each supported DPLL.

- Holdover Mask for the current active (locked to) reference: HOMask<3:0>, these mask bits masks the failure indicators that are used to go into auto-holdover independently for each supported DPLL.
- MSB bit for CFM and LSB bit for GST

The single cycle and coarse monitor failure flags feed a timer (Guard Soak Timer) that disqualifies the reference input signal when the failures are present for more than the period of time defined in Table 2.

Guard Soak Timer Control bits in control register	Time to disqualify a reference in Timing Card Application	Notes
00	minimum delay possible	
01	10 ms	
10	50 ms	default value
11	2.5 s	

**Table 2 - Guard Soak Time To Disqualify a Reference**

The Guard Soak Timer that is used for the CFM and SCM modules has a built-in decay time hysteresis according to Table 3 (Timer to Qualify a reference) to prevent flickering of status bits at the threshold boundaries.

The Timer to Qualify a reference is a multiple of the Guard Soak Timer. Table 3 shows the multiplication factor to multiply the Guard Soak Timer to calculate the time to qualify a reference.

Control bits to control the Timer to qualify a reference	Multiples of the Guard Soak Time to qualify a reference	Notes
00	2	
01	4	Default value
10	16	
11	32	

**Table 3 - Guard Soak Time To Qualify a Reference**

When a GPIO pin is used as a reference fail indicator, it indicates a valid reference if:

- The SCM does not detect phase hits, nor complete loss of clock or Ref<i>FailMask<0> is at logic “0”
- The CFM does not detect phase irregularity or Ref<i>FailMask<1> is at logic “0”
- The Guard Soak Time is triggered or Ref<i>FailMask<2> is at logic “0”

### 4.3 Digital Phase Locked Loop (DPLL)

The device supports four independent digital PLL modules. Initial default configuration defines two active DPLLs.

The device has the option to enable remaining two digital PLLs. This allows the device to synchronize to 4 independent reference clocks with 4 independent digital PLLs.

#### 4.3.1 DPLL General Characteristics

##### Pull-in Hold-in range

The DPLL supports pull-in/hold-in of +/-52 ppm, +/-130 ppm, +/-400 ppm or +/-3900 ppm.

### DPLL bandwidth (jitter/wander transfer)

The DPLL supports the following first order filtering cut-off frequencies: 14 Hz, 28 Hz, 56 Hz, 112 Hz, 224 Hz, 448 Hz and 896 Hz. DPLL bandwidth is determined during the initialization. Dynamic change of DPLL bandwidth is supported. When changing the bandwidth dynamically, it is recommended to put DPLL to the Holdover mode first and then to change the bandwidth. After the bandwidth has been changed, the DPLL should be set to the Normal mode.

The DPLL locks to an input reference and provides stable low jitter output clock if the selected loop bandwidth is less than 1/30th the input reference frequency. As an example, a 19.44 MHz reference could deploy a bandwidth up to 896 Hz, and a 1 kHz input reference would deploy a loop bandwidth of 14 Hz. For 8 kHz reference we recommend a maximum loop bandwidth of 56 Hz.

### Jitter/Wander Generation

Jitter and wander generation performances are provided in section 10.0, "Performance Characterization".

### Phase Transients

On reference switch with phase tracking active (i.e., TIE clear active or glitch-less reference switching), the DPLL transitions the phase of the output smoothly, limited by the selected loop bandwidth and by the selected phase slope limit.

The Microsemi device offers the following phase slope limiting options: 61 usec/sec, 7.5 usec/sec, 0.885 usec/sec or unlimited.

### Holdover Stability

DPLL initial holdover accuracy is better than 50 ppb.

### Input Tolerance Criteria

Input tolerance indicates that the device tolerates certain jitter, wander and phase transients at its input reference while maintaining outputs within an expected performance and without experiencing any alarms, reference switching or holdover conditions. Input tolerance is associated with input reference source characteristics and the standards associated with input reference type.

### DPLL Monitoring

The DPLL provides lock and holdover indicators using the default lock indicator conditions.

The lock time is dependent on employed loop bandwidth. The device has a lock time of less than 1 sec for all available DPLL loop bandwidth selections.

### 4.3.2 DPLL States

The device DPLL(s) supports three DPLL states: Free-run, Normal (Locked) and Holdover. The Holdover and Free-run states are used to cope with reference impairments.

Each of these modes have a corresponding state in the internal State Machine described as follows:

**Freerun State:** the Freerun state is entered when synchronization to the reference is not required or is not possible. Typically this occurs immediately following system power-up. In the Freerun State, the device provides timing and synchronization signals which are based on the master clock frequency (supplied to osci pin) only, and are not synchronized to the reference input signals. The freerun accuracy of the output clock is equal to the accuracy of the master clock (osci). So if a  $\pm 20$  ppm freerun output clock is required, the master clock must also be  $\pm 20$  ppm.

**Holdover State:** the Holdover State is typically entered when input reference is temporarily disrupted. In the Holdover State, the device provides output clocks which are not locked to an external reference signal, but are based on storage techniques. The storage value is determined while the device is in Normal Mode and locked to an external reference signal. Initial holdover accuracy is a function of DPLL while holdover drift is reliant on the drift of the master clock (osci).

**Normal State:** the Normal State is entered when a valid reference clock is available for synchronization. In the Normal State the device provides output clocks which are synchronized to one of the available 4 input references. From a reset condition - if a valid input reference is available - the device takes less than a second (lock time) to output signals which are synchronized (phase and frequency locked) to the reference input.

### 4.3.3 DPLL Rate Conversion Function and FEC Support

The DPLL supports rate conversion with a 16 bit forward divider and a 16 bit feedback divider.

The DPLL provides up scaling and down scaling functions.

The DPLL has the ability to switch from normal rate (before FEC is negotiated) to FEC rate and vice versa.

The DPLL supports simple rate conversion (i.e., take in 19.44 MHz and create 255/238 FEC SONET clock of 666.51 MHz), and supports double rate conversion (i.e., take in 19.44 MHz, create FEC 10 GbE clock of 644.5313, which is 66/64 rate converted 625 MHz, or create 690.5692 which is 255/238X66/64 rate converted 625 MHz)

The following is just an example of the frequencies that can be supported (many more frequencies can be supported):

- **GbE:**
  - 25 MHz
  - 125 MHz
- **XAUI (chip to chip interface, which is a common chassis to chassis interface):**
  - 156.25 MHz or x2 or x4 version
- **OC-192/STM-64:**
  - 155.52 MHz or x2 or x4 version
  - 155.52 MHz x 255/237 (standard EFEC for long reach) or x2 or x4 version
  - 155.52 MHz x 255/238 (standard GFEC for long reach) or x2 or x4 version
- **10 GbE:**
  - 156.25 MHz which is 125 MHz x 10/8 or x2 or x4 version
  - 155.52 MHz x 66/64 or x2 or x4 version
  - Long reach 10 GE might require the following frequencies with simple rate conversion: (156.25 MHz x 255/237) and (156.25 MHz x 255/238).
  - The following frequencies with double rate conversion: (155.52 MHz x 66/64 x 255/237) or (155.52 MHz x 66/64 x 255/238) and (156.25 MHz x 66/64 x 255/238) or (156.25 MHz x 66/64 x 255/238). Also, user can use x2 or x4 version of the listed frequencies.

Application Note ZLAN-267 explains how to generate the most common frequencies.

#### 4.3.4 DPLL Input to Output and Output to Output Phase Alignment

##### Techniques offered for Phase Alignment

When the output clock is locked to a jitter free and wander free input clock, input to output latency is expected to have a typical error of 0 nsec.

The coarse and fine phase adjustments allow for input to output and output to output latency corrections to compensate for PCB load delay, as detailed in 4.7, "Output Drivers".

The PLL architecture allows for implementation of an external feedback (external output clock phase sense) of the PLL path that is fed through one of the available references (REF 0, 1, 2 or 3). Such external feedback would allow for dynamic changes of PCB routing and external buffer delay caused by changes in temperature.

External feedback cannot be used if synthesizer in the feedback path is programmed such that  $Bs \cdot Ks \cdot Ms / Ns = 65,536,000$ .

#### 4.4 Frequency Synthesis Engine

The device frequency synthesis engine is comprised of a hardware DCO and an analog jitter filtering APLL with built-in digital jitter attenuation scheme. It has two ultra low jitter frequency synthesis engines that can generate output clocks which meet the jitter generation requirements detailed in section 10.0, "Performance Characterization".

The frequency synthesis engines can generate any clock which is  $(M/N \times 1 \text{ kHz})$  multiple (FEC rate converted clock). The M and N are 16 bits wide.

When the DPLL is locked to an input reference, the DCO external control can be used. The DCO external control allows for the calibration of the DCO center frequency to adjust for external system oscillator center frequency. One setting will control the center frequency of all active DCOs.

#### 4.5 Dividers and Skew Management

The device has 4 independent dividers associated with each frequency synthesis engine.

The divider engines associated with the high performance differential outputs generate output clocks between 1 kHz and 750 MHz with 50% duty cycle. The other divider engines generate output clocks between 1 kHz and 177.5 MHz for high performance LVCMOS outputs and 160 MHz for single ended configurable outputs with 50% duty cycle. When configurable outputs are in differential mode, the maximum frequency is 350 MHz.

The divider modules generating the single ended output clocks provides the ability to manage the phase skew of the output clock by a coarse step equal to the internal high speed clock period.

The single ended generated output clocks can be stopped either on rising or falling edge (programmed through serial interface or GPIO).

The device can be configured to adjust the phase skew of single ended clocks in steps of sub high speed synthesizer clock cycle period.

#### 4.6 Output Multiplexer

Figure 5 shows the multiplexing configuration that is supported.

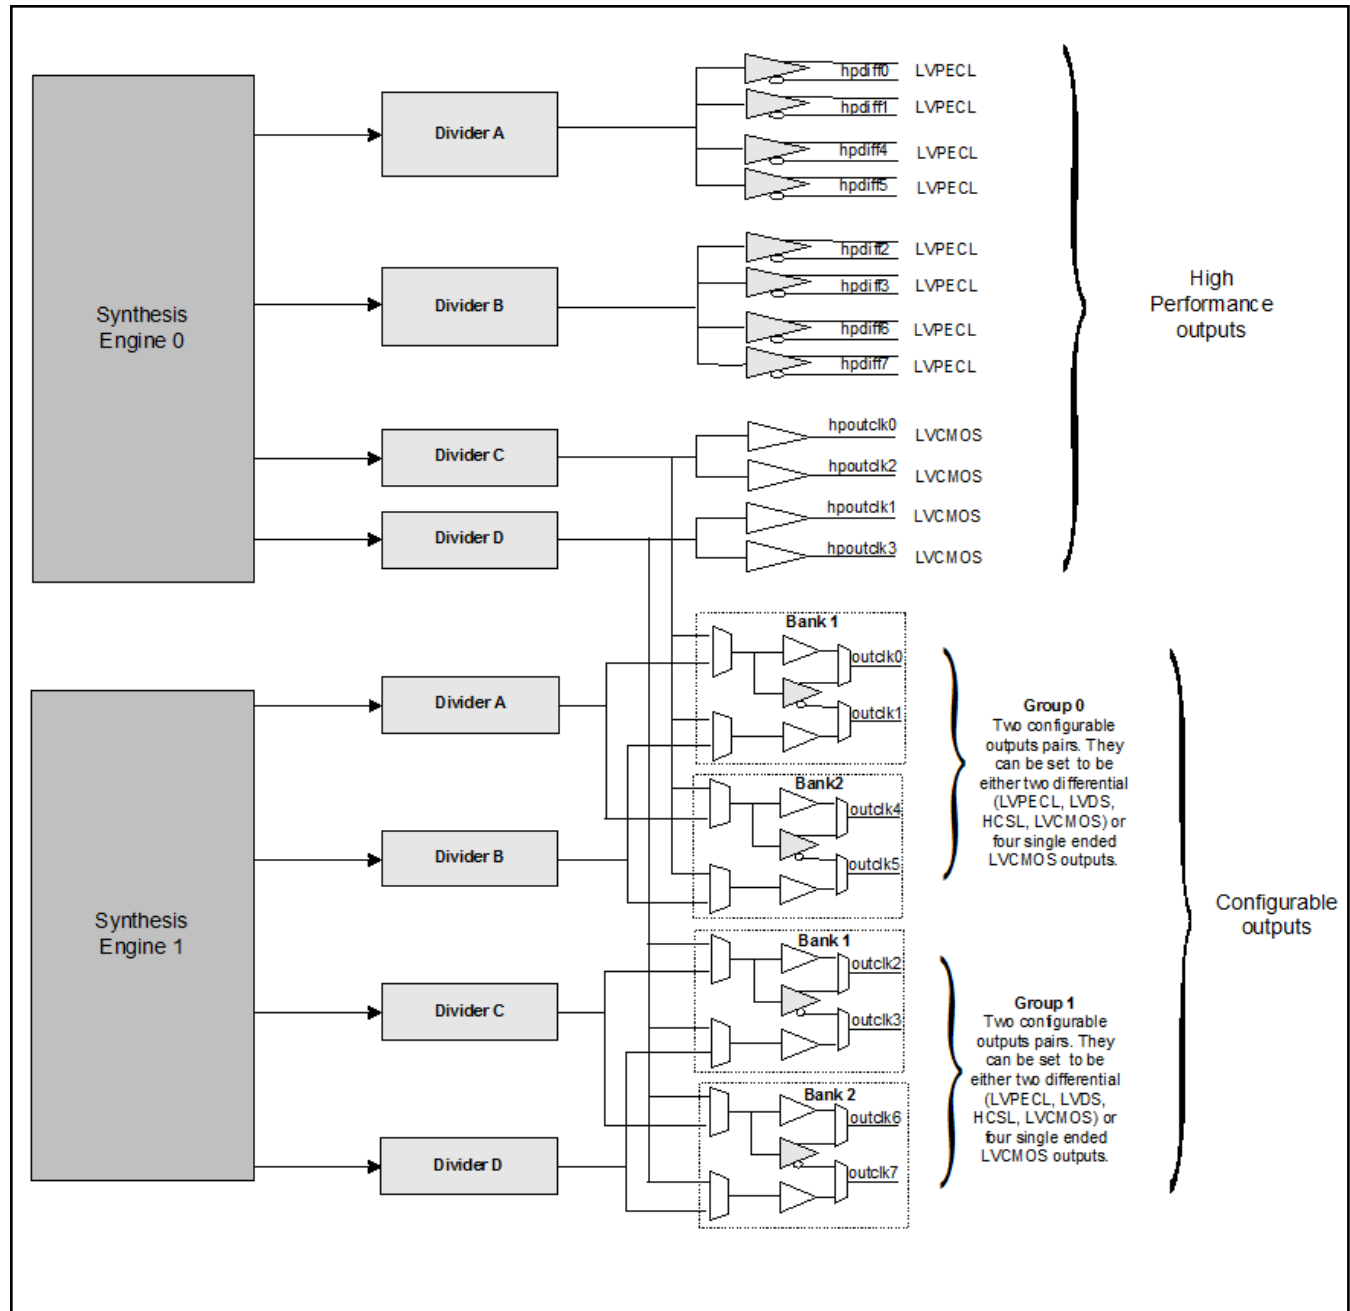

Figure 5 - Output Clocks Muxing Configuration

## 4.7 Output Drivers

The device has 8 high performance (HP) differential (LVPECL) outputs.

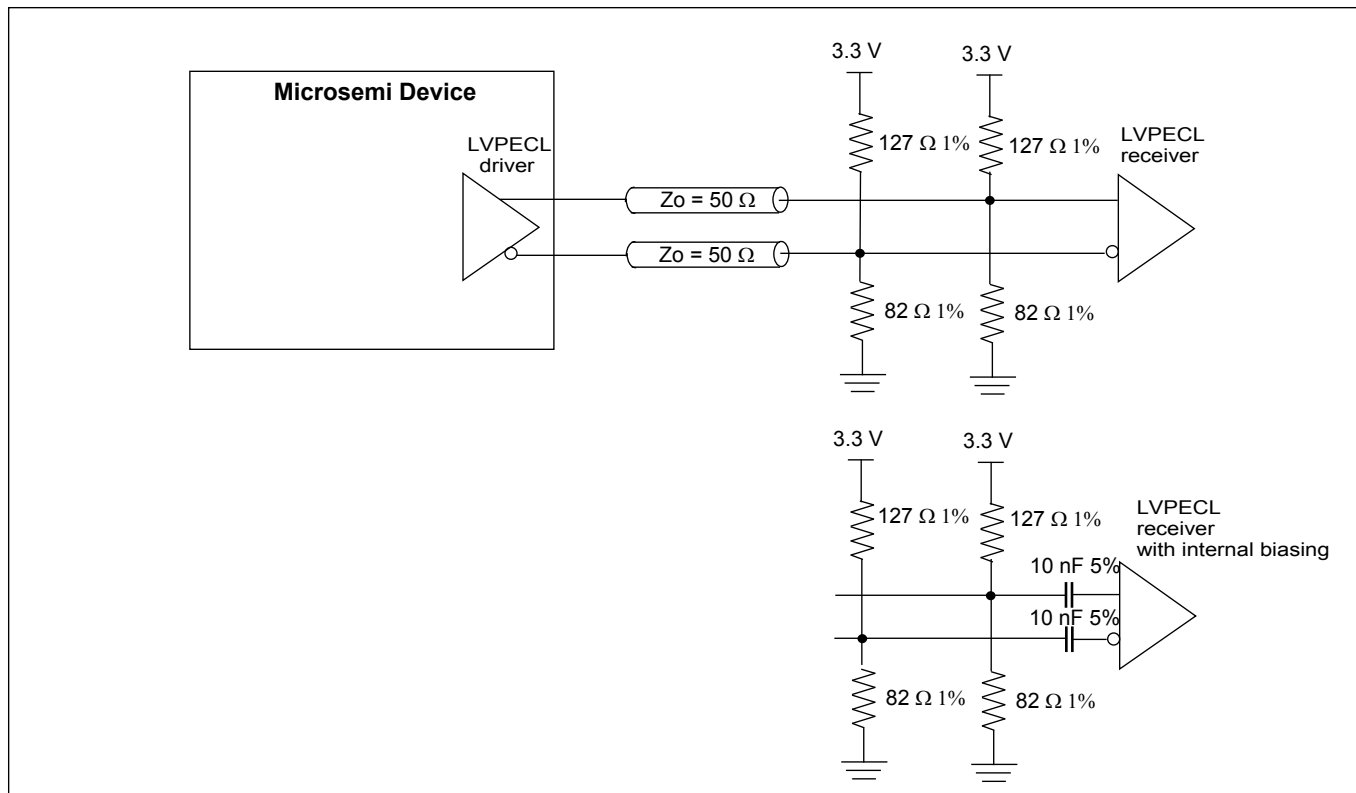

The device has 4 high performance (HP) single ended (LVCMOS) outputs.

The device also has 2 groups of configurable output drivers. Each group can be set as a 4 single ended drivers (LVCMOS) or as a 2 differential output drivers (LVPECL, LVDS, or HCSL). Each group is further subdivided to two Banks (Bank 1 and 2). Each output bank has its own power supply pin, so that configurable outputs can be powered from 3.3 V, 2.5 V, 1.8 V or 1.5 V supplies when used as single ended LVCMOS outputs. When configurable outputs are use in differential mode both banks has to be powered by 3.3 V supply.

High Performance (HP) single ended driver (LVCMOS) supports the jitter specification detailed in section 10.0, "Performance Characterization" and a maximum speed of 177.5 MHz.

The high performance (HP) differential driver (LVPECL) supports the jitter specification detailed in section 10.0, "Performance Characterization" and a maximum speed of 750 MHz.

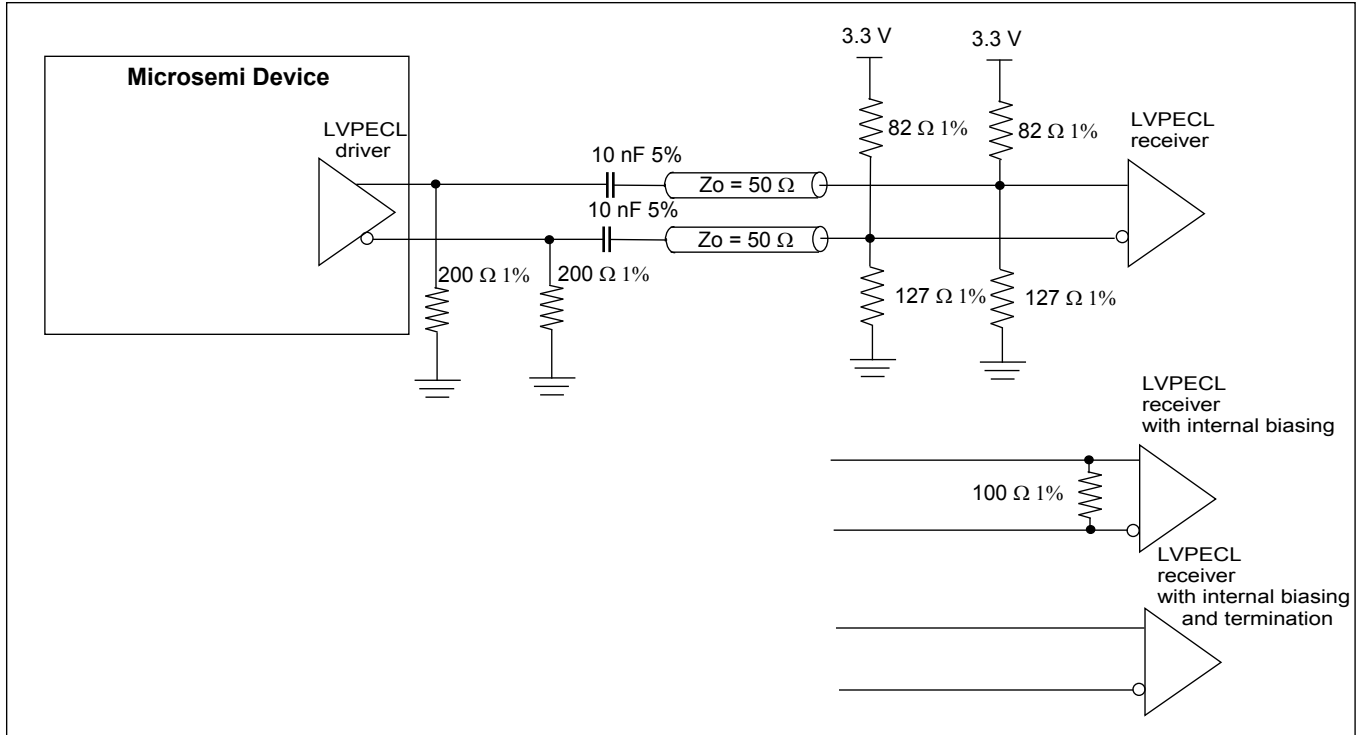

LVPECL outputs should be terminated as shown in Figure 6. Terminating resistors provide 50  $\Omega$  equivalent Thevenin termination as well as biasing for the output LVPECL driver. Terminating resistors should be placed as close as possible to input pins of the LVPECL receiver. If the LVPECL receiver has internal biasing then AC coupling capacitors should be added.

**Figure 6 - Terminating LVPECL Outputs**

If the transmission line is required to be AC coupled then the termination shown in Figure 7 should be implemented. 200  $\Omega$  resistors are used to provide DC biasing for LVPECL driver. Both AC coupling capacitor and biasing resistors should be placed as close as possible to output pins.

Thevenin termination ( $127\ \Omega$  and  $82\ \Omega$  resistor) provide  $50\ \Omega$  termination as well as biasing of the input LVPECL receiver. If the LVPECL receiver has internal DC biasing then the line should be terminated with  $100\ \Omega$  termination resistor between positive and negative input. In both cases termination resistors should be placed as close as possible to the LVPECL receiver pins. Some LVPECL receivers have internal biasing and termination. In this case no external termination should be present.

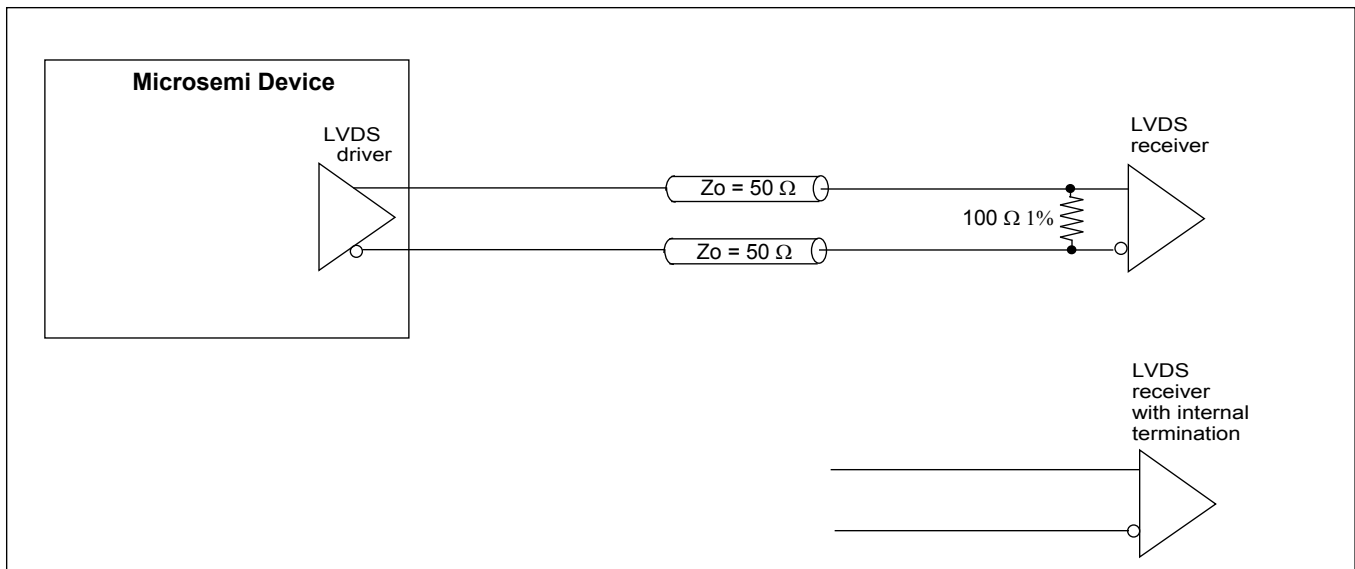

**Figure 7 - Terminating AC coupled LVPECL Outputs**

High performance LVCMOS outputs (hpoutclkx) should be terminated at the source with  $22\ \Omega$  resistor as shown in Figure 8. The same type of termination should be used for configurable outputs when they are set to be LVCMOS.

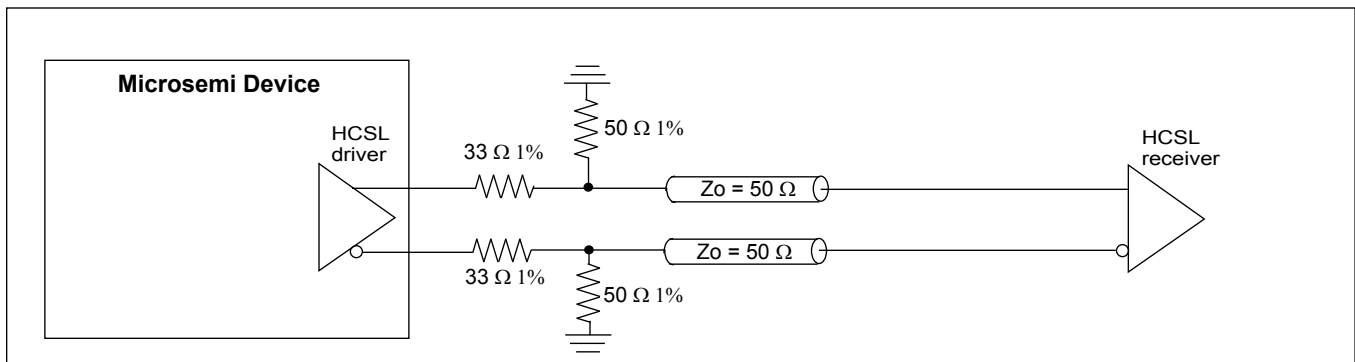

**Figure 8 - Terminating LVCMOS Outputs**

If the differential output drivers are programmed to be LVDS the termination in Figure 9 should be used.

**Figure 9 - Terminating LVDS Outputs**

When configurable outputs are set to be HCSSL, the termination shown in Figure 10 should be used.

**Figure 10 - Terminating HCSSL Outputs**

#### 4.7.1 Configurable Single Ended Driver - Slew Rate Control

Slew rate of configurable single ended drivers can be programmed to be either fast or medium.

Fast slew rate should be used to:

- Buffer high speed single ended (CMOS) output clock (up to 160 MHz) and/or
- Buffer single ended (CMOS) output clock on a large output load (up to 30 pF)
- Provide rail to rail single ended output clock for any selection of output drive supply voltage (1.5, 1.8, 2.5, 3.3 Volt)

Medium slew rate should be used to:

- Maintain limited output clock ringing and PCB output clocks cross modulation when driving low speed output clock or when small load is present at the output

Each of the available single ended configurable outputs of the device has 2 available slew rate control limits. These limits are user selectable based on: output clock speed, expected output load or output supply voltage. Table 4 details the limits and the expected output clock slew rates.

	Slew Rate for Fast Slew		Slew Rate for Medium Slew	
	10 pF	20 pF	10 pF	20 pF
Expected Load				
Output Clock 80 MHz or less	1.62 V/ns	1.47 V/ns	0.93 V/ns	0.96 V/ns
Output Clock 160 MHz or less	1.58 V/ns	1.38 V/ns	1.09 V/ns	1.08 V/ns

**Table 4 - Slew Rate Control Limits Versus Output Clock Slew Rates**

## 4.8 Input Buffers

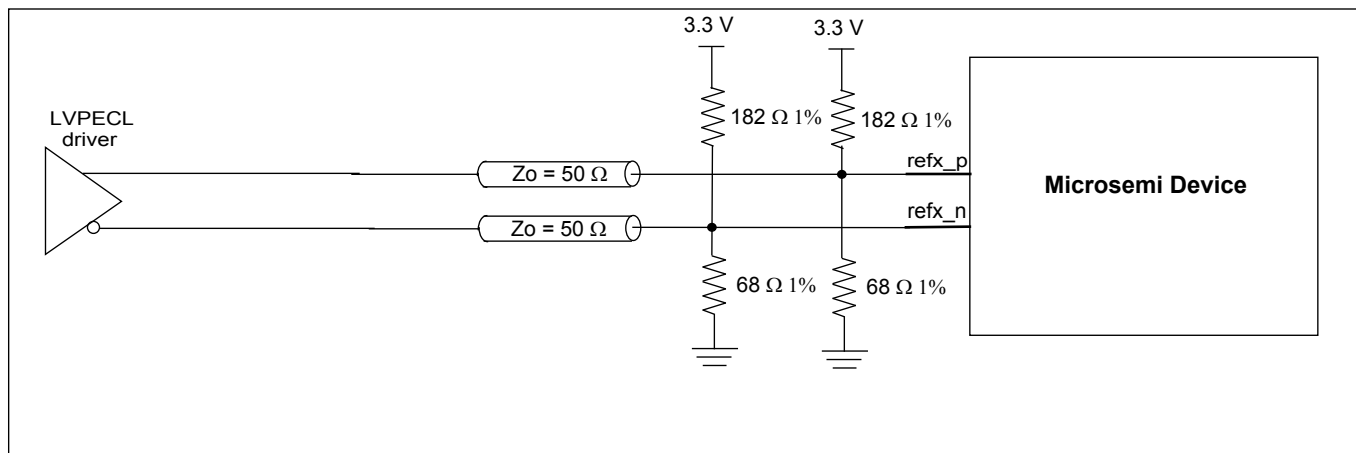

ZL30157 has four reference inputs  $\text{ref}[3:0]_{\text{p}}/\text{ref}[3:0]_{\text{n}}$  that can work as either single ended or differential. By default  $\text{ref0}$  is differential and the others are single ended. This can be changed by programming  $\text{ref\_config}$  register at address  $0x0A$ .

Input frequency range for differential inputs is: 1 kHz to 750 MHz; for single ended inputs is: 1 kHz to 177.5 MHz.

Differential reference inputs need to be properly terminated and biased as shown in Figure 11 and Figure 12 for LVPECL and Figure 13 and Figure 14 for LVDS drivers. When terminating LVPECL signal, it is necessary either to adjust termination resistors for DC coupling or to AC couple the LVPECL driver because ZL30157 differential inputs have different common mode (bias) voltage than LVPECL receivers. Thevenin termination ( $182\ \Omega$  and  $68\ \Omega$  resistors) provide 50 ohm equivalent termination as well as biasing of the input buffer for DC coupled line. For AC coupled line, Thevenin termination with  $127\ \Omega$  and  $82\ \Omega$  resistors should be used as shown in Figure 12. The value of the AC coupling capacitors will depend on the minimum reference clock frequency. The value of 10 nF is good for input clock frequencies above 100 MHz. For lower clock frequencies capacitor values will have to be increased.

Terminations for DC and AC coupled LVDS line are shown in Figure 13 and Figure 14 respectively. Differential input biasing is provided by LVDS driver in case of DC coupling (Figure 13), whereas for AC coupling (Figure 14) biasing is generated by  $12\ \text{k}\Omega$  and  $8.2\ \text{k}\Omega$  resistors. In both cases, the line is terminated with  $100\ \Omega$  resistor.

For single ended CMOS inputs,  $\text{refx}_{\text{n}}$  input needs to be connected to the ground as shown in Figure 15. The value of series termination resistor will depend on CMOS output driver but the most common values are  $33\ \Omega$  and  $22\ \Omega$ .

**Figure 11 - Differential DC Coupled LVPECL Termination**

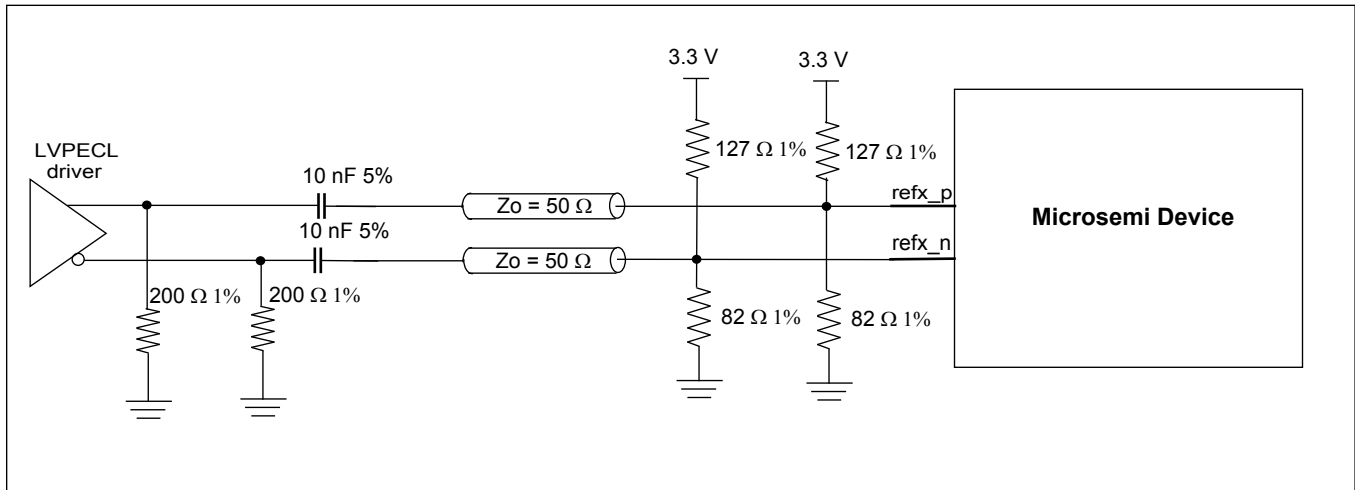

Figure 12 - Differential AC Coupled LVPECL Termination

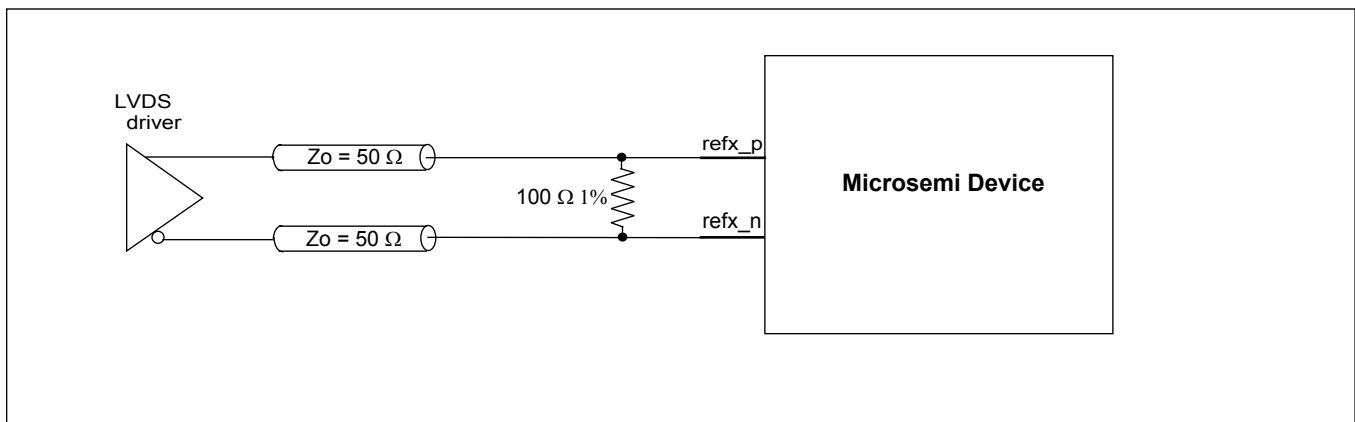

Figure 13 - Differential DC Coupled LVDS Termination

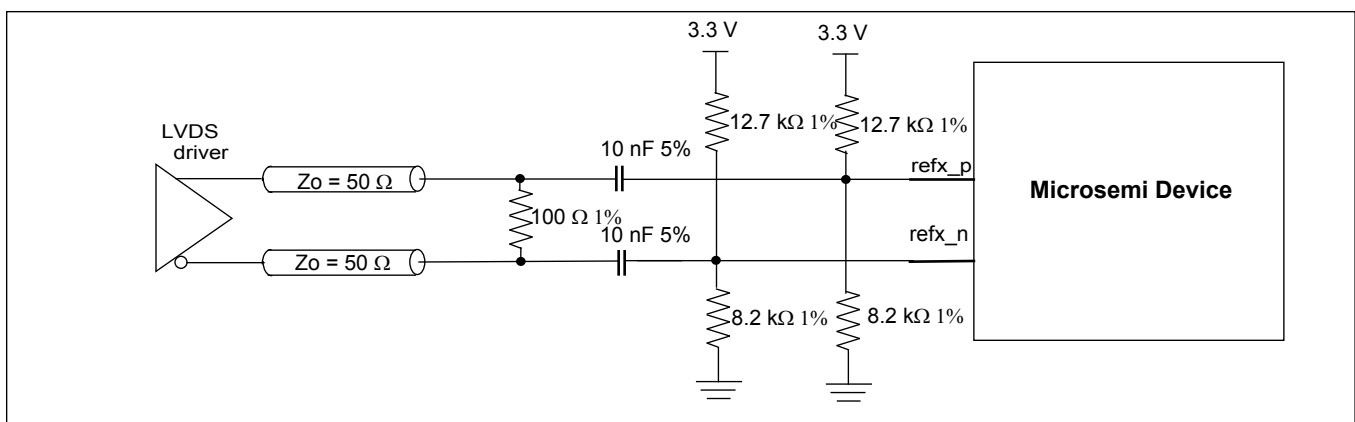

Figure 14 - Differential AC Coupled LVDS Termination

Figure 15 - Single Ended CMOS Termination

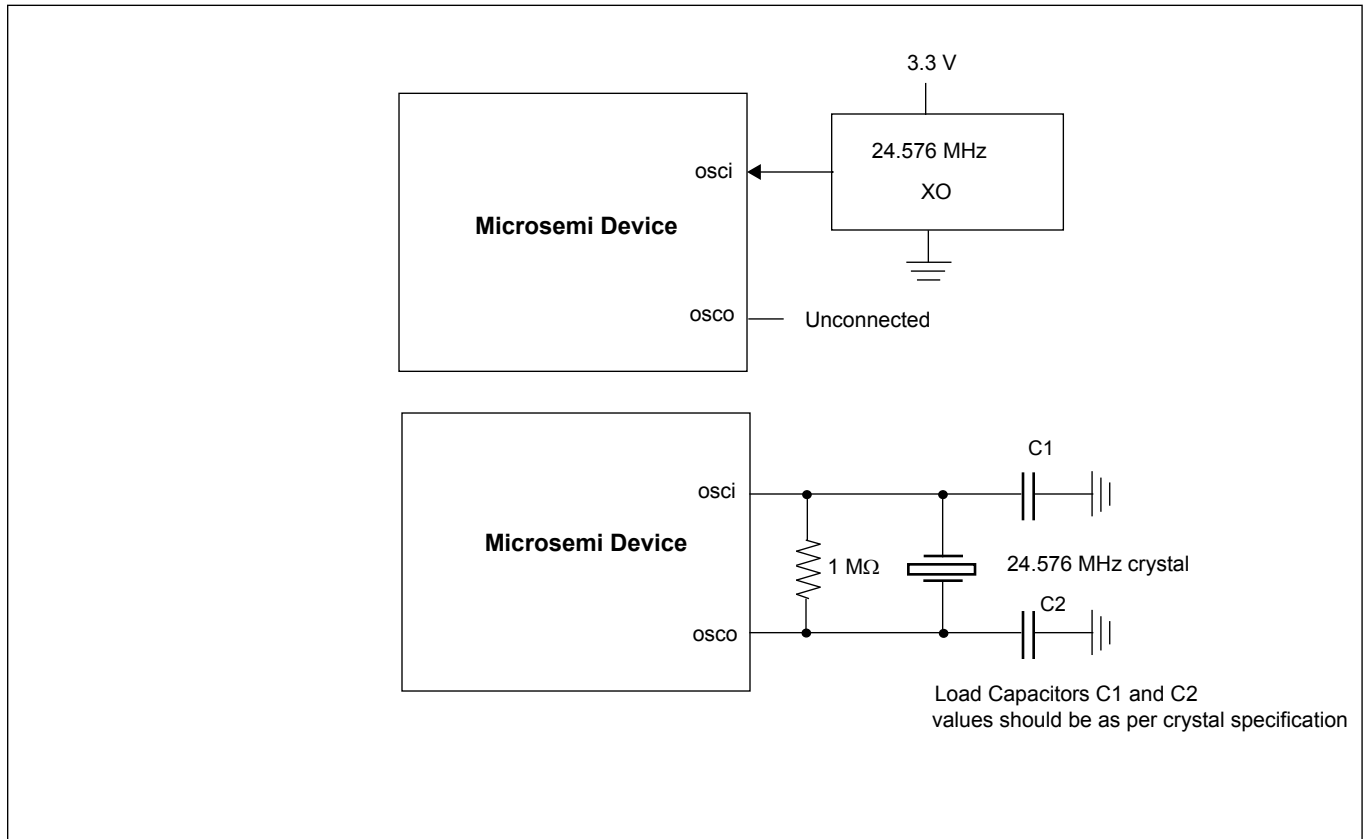

#### 4.9 Master Clock Interface

The master oscillator determines the DPLL's free-run frequency accuracy and holdover stability. The reference monitor circuitry also uses this frequency as its point of reference (0 ppm) when making frequency measurements. The master clock interface was designed to accept either a free-running clock oscillator (XO) or a crystal (XTAL). Refer to application note ZLAN-68 for a list of recommended clock oscillators.

#### 4.10 Clock Oscillator

When using a clock oscillator as the master timing source, connect the oscillator's output clock to the **osci** pin as shown in Figure 16. The connection to **osci** should be direct and not AC coupled. The **osco** pin must be left unconnected.

When using crystal resonator as the master timing source, connect crystal between **osci** and **osco** pins as shown in Figure 16. Crystal should have bias resistor of 1 MΩ and load capacitances C1 and C2. Value of load capacitances is dependent on crystal and should be as per crystal datasheet. Crystal should be a fundamental mode type -- not an overtone. See ZLAN-68 for crystal recommendation.

**Figure 16 - Clock Oscillator Circuit**

The device internal system clocks are generated off the device master clock input (Oscillator or a crystal employing an on-chip buffer/driver). The master clock selection is done at start-up using the available GPIO pins, right after pwr\_b get de-asserted. The GPIO[1:0] pins need to be held high for 50 ms after the de-assertion of pwr\_b, after which time they can be released and used as any other GPIO. Alternatively, these pins can be pulled high with 1 kΩ resistors.

GPIO [1:0]	Master Clock Frequency
0	reserved
1	reserved
2	reserved
3	24.576 MHz

**Table 5 - Master Clock Frequency Selection**

#### 4.11 Power Up/Down Sequence

The 3.3 V supply should be powered before or simultaneously with the 1.8 V supply. The 1.8 V supply must never be greater than the 3.3 V supply by more than 0.3 V. The 1.5V/1.8V/2.5V/3.3V configurable output supply must never be greater than the 3.3V supply by more than 0.3V.

The power-down sequence is less critical, however it should be performed in the reverse order to reduce transient currents that consume power.

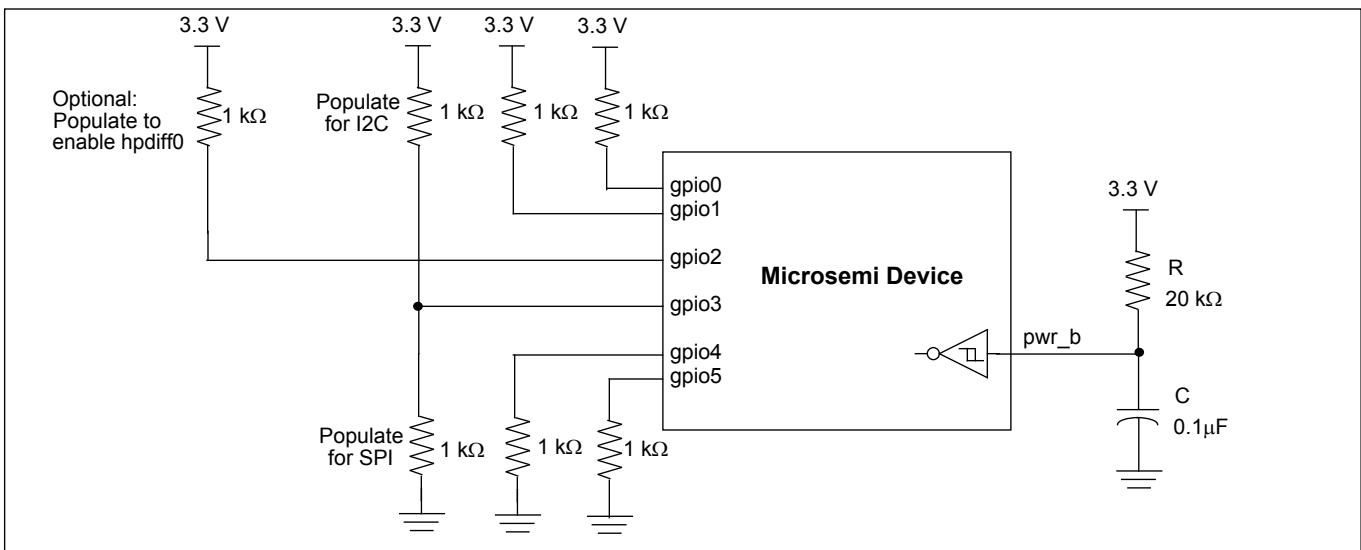

#### 4.12 Power Supply Filtering

Jitter levels on the output clocks may increase if the device is exposed to excessive noise on its power pins. For optimal jitter performance, the device should be isolated from noise on power planes connected to its 3.3 V and 1.8 V supply pins. For recommended common layout practices, refer to Application Note ZLAN-269.

#### 4.13 Reset and Configuration Circuit

To ensure proper operation, the device must be reset by holding the pwr\_b pin low for at least 2 ms after power-up when 3.3 V and 1.8 V supplies are stable. Following reset, the device will operate under specified default settings.

The reset pin can be controlled with on-board system reset circuitry or by using a stand-alone power-up reset circuit as shown in Figure 17. This circuit provides approximately 2 ms of reset low time. The pwr\_b input has Schmidt trigger properties to prevent level bouncing.

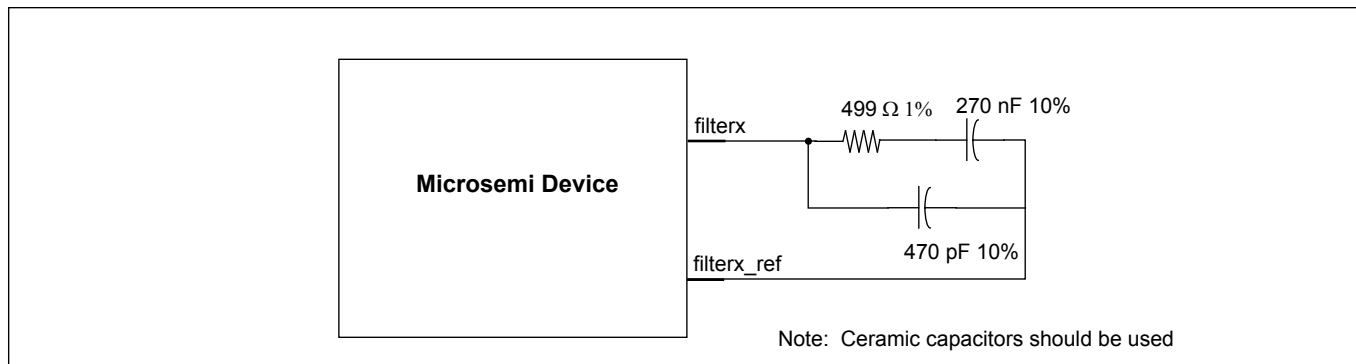

**Figure 17 - Typical Power-Up Reset and Configuration Circuit**

General purpose pins gpio[0,1,3,4,5] are used to configure device on the power up. They have to be pulled up/down with 1 kΩ resistors as shown in Figure 17 or they can be pulsed low/high during the pwr\_b low pulse and kept at the same level for at least 50 ms after pwr\_b goes high. After 50 ms they can be released and used as general purpose I/O as described in Section 6.0.

By default all outputs are disabled to allow user first to program required frequencies for different outputs and then to enable corresponding outputs. During the prototype phase, hardware designer can verify if the device is working properly even before software driver is implemented just by pulling up gpio2 pin which enables hpdif0 output (generates 622.08 MHz by default).

#### 4.14 Ultra Low Jitter Synthesizer Filter Components and Recommended Layout

The APLL for the ultra low jitter synthesizer in the Microsemi device uses external components to help optimize its loop bandwidth. For optimal jitter performance, the following component values are recommended:

**Figure 18 - APLL Filter Component Values**

Recommended layout for loop filters is shown in Figure 19:

**Figure 19 - Recommended Layout for Loop Filters**

## 5.0 Configuration and Control

The ZL30157 configuration is composed of 253 x 8 bits. The configuration registers are assigned their values by any of the following three methods:

- 1) Default configuration
- 2) Custom OTP (One Time Programmable) configuration
- 3) SPI/I2C configuration

The SPI/I2C host interface allows field programmability of the device configuration registers. As an example, user might start the device at nominal SONET rate, then switch to an FEC rate once the link FEC rate is negotiated.

### 5.1 Custom OTP Configuration

At power-up the device sets its configuration registers to the user defined custom configuration values stored in it's OTP (One Time Programmable). Custom configurations can be generated using Microsemi's Clockcenter GUI software (ZLS30CLKCTR). For custom configured devices contact your local Microsemi Field Applications Engineer or Sales Manager.

### 5.2 GPIO Configuration and Programmability

The device GPIO is mapped by the SPI/I2C programmability. The following is an example of control and status signals that can be supported:

- DPLL lock indicators
- DPLL holdover indicators
- Reference 0, 1, 2, and 3 fail indicators
- Reference select control or monitor
- Differential output clock enable (per output or as a bank of 2 or 4 outputs)
- Host Interrupt Output: flags changes of device status prompting the processor to read the enabled interrupt service registers (ISR)
- Output clock stop/start

The following table defines the function of the GPIO pin when configured as a control pin. Configuring the value in bit 6:0 in GPIO configuration registers enables the stated function.

Value	Name	Description
<b>Default</b>		
0x00	Default	GPIO defined as an input. No function assigned.
<b>Input References</b>		
0x10	Ref0 external LOS signal	Ref0 external Loss Of Signal (LOS) - indicator to DPLLs that Ref0 has failed. Internally in the DPLLs this signal is used for reference monitor indicator, reference switching or holdover entering and for ISR generation.
0x14	Ref1 external LOS signal	Same description as REF0 external LOS
0x18	Ref2 external LOS signal	Same description as REF0 external LOS
0x1C	Ref3 external LOS signal	Same description as REF0 external LOS
<b>DPLL</b>		

Value	Name	Description
0x20	DPLL0 Time Interval Error (TIE) clear enable	This signal is OR-ed with the 'DPLL0 TIE clear enable' bit of the 'DPLL control' register. Functionality of this signal is explained in the 'DPLL control' register.
0x28	DPLL1 Time Interval Error (TIE) clear enable	Same description as DPLL0 TIE clear enable
<b>Synthesizer Post Divider</b>		
0x44	Stop output clock from Synthesizer0 Post Divider C bit1	This signal is OR-ed with the 'Synthesizer0 Post Divider C stop clock' bit1 in the 'Synthesizer0 and Synthesizer1 Post Dividers stop clock' register.
0x45	Stop output clock from Synthesizer0 Post Divider C bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x46	Stop output clock from Synthesizer0 Post Divider D bit1	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x47	Stop output clock from Synthesizer0 Post Divider D bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x50	Stop output clock from Synthesizer1 Post Divider A bit1	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x51	Stop output clock from Synthesizer1 Post Divider A bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x52	Stop output clock from Synthesizer1 Post Divider B bit1	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x53	Stop output clock from Synthesizer1 Post Divider B bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x54	Stop output clock from Synthesizer1 Post Divider C bit1	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x55	Stop output clock from Synthesizer1 Post Divider C bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x56	Stop output clock from Synthesizer1 Post Divider D bit1	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x57	Stop output clock from Synthesizer1 Post Divider D bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
<b>High Performance Differential Outputs</b>		

Value	Name	Description
0x60	Enable Differential output HPDIFF0	This signal is OR-ed with the 'Enable HPDIFF0' bit in the 'High performance differential output enable' register. Functionality of this signal is explained in hpdiff_en register.
0x62	Enable Differential output HPDIFF1	Same description as Enable Differential output HPDIFF0
0x64	Enable Differential output HPDIFF2	Same description as Enable Differential output HPDIFF0
0x66	Enable Differential output HPDIFF3	Same description as Enable Differential output HPDIFF0
0x68	Enable Differential output HPDIFF4	Same description as Enable Differential output HPDIFF0
0x6A	Enable Differential output HPDIFF5	Same description as Enable Differential output HPDIFF0
0x6C	Enable Differential output HPDIFF6	Same description as Enable Differential output HPDIFF0
0x6E	Enable Differential output HPDIFF7	Same description as Enable Differential output HPDIFF0
<b>High Performance CMOS Outputs</b>		
0x70	Enable HPOUTCLK0	This signal is OR-ed with the 'Enable HPOUTCLK0' bit in the 'High performance CMOS output enable' register.
0x72	Enable HPOUTCLK1	Same description as Enable HPOUTCLK0
0x74	Enable HPOUTCLK2	Same description as Enable HPOUTCLK0
0x76	Enable HPOUTCLK3	Same description as Enable HPOUTCLK0

The following table defines the function of the GPIO pin when configured as a status pin. Configuring the value in bit 6:0 in GPIO configuration registers enables the stated function.

Value	Name	Description
<b>Interrupt</b>		
0x80	Interrupt output signal	This bit will be high if the interrupt has been asserted.
<b>Input References</b>		
0x88	Ref0 - Signal not present in last second	This bit will be high if Ref0 signal was not toggling in the last second.
0x89	Ref0 Single Cycle Measurement (SCM) failure	This bit will be set if Ref0 SCM indicator is active (see 'Ref0 SCM and CFM limits' register for SCM limits).
0x8A	Ref0 Coarse Frequency Measurement (CFM) failure	This bit will be set if Ref0 CFM indicator is active (see 'Ref0 SCM and CFM limits' register for CFM limits).
0x8B	Ref0 Guard Soak Timer (GST) indicator	Ref0 Guard Soak Timer (GST) indicator

Value	Name	Description
0x8C	Ref0 failure indicator	This bit will be set if either Ref0 external LOS signal is high, or Ref0 SCM, CFM or GST indicator is high, and appropriate mask bit in the 'Ref0 and Ref1 failure mask' register is set to 1 (not masked).
0x90	Ref1 - Signal not present in last second	Same description as for Ref0
0x91	Ref1 Single Cycle Measurement (SCM) failure	Same description as for Ref0
0x92	Ref1 Coarse Frequency Measurement (CFM) failure	Same description as for Ref0
0x93	Ref1 Guard Soak Timer (GST) indicator	Same description as for Ref0
0x94	Ref1 failure indicator	Same description as for Ref0
0x98	Ref2 - Signal not present in last second	Same description as for Ref0
0x99	Ref2 Single Cycle Measurement (SCM) failure	Same description as for Ref0
0x9A	Ref2 Coarse Frequency Measurement (CFM) failure	Same description as for Ref0
0x9B	Ref2 Guard Soak Timer (GST) indicator	Same description as for Ref0
0x9C	Ref2 failure indicator	Same description as for Ref0
0xA0	Ref3 - Signal not present in last second	Same description as for Ref0
0xA1	Ref3 Single Cycle Measurement (SCM) failure	Same description as for Ref0
0xA2	Ref3 Coarse Frequency Measurement (CFM) failure	Same description as for Ref0
0xA3	Ref3 Guard Soak Timer (GST) indicator	Same description as for Ref0
0xA4	Ref3 failure indicator	Same description as for Ref0
<b>DPLL Filters</b>		
0xA8	DPLL0 Normal mode indicator	This bit will be set when DPLL0 is in normal locking mode (not holdover, not freerun)
0xA9	DPLL0 holdover mode indicator	This bit will be set when DPLL0 is in holdover mode

Value	Name	Description
0xAA	DPLL0 used reference bit1	This bit in combination with DPLL0 ref sel bit0 represents DPLL0 selected reference. Selection: bit1 bit0 0 0 = Ref0 0 1 = Ref1 1 0 = Ref2 1 1 = Ref3
0xAB	DPLL0 used reference bit0	See bit1 description
0xB0	DPLL0 Lock Indication 1	This bit will be set when DPLL0 phase error is less than 1 us during 1 s period.
0xB1	DPLL0 Lock Indication 2	This bit will be set when DPLL0 phase error is less than 10us during 1 s period.
0xB2	DPLL0 Lock Indication 3	This bit will be set when DPLL0 phase error is less than 10 us during 10 s period.
0xB8	DPLL1 Normal mode indicator	Same description as for DPLL0
0xB9	DPLL1 holdover mode indicator	Same description as for DPLL0
0xBA	DPLL1 used reference bit1	Same description as for DPLL0
0xBB	DPLL1 used reference bit0	Same description as for DPLL0
0xC0	DPLL1 Lock Indication 1	Same description as for DPLL0
0xC1	DPLL1 Lock Indication 2	Same description as for DPLL0
0xC2	DPLL1 Lock Indication 3	Same description as for DPLL0

### 5.3 Configuration and Field Programmability Registers

This section refers to configuration registers (field programmable) that are set by the user to define device operation.

#### 5.3.1 Input Reference Configuration and Programmability

The following is the set of parameters that are configurable:

- Input reference frequency as multiple of 1 kHz, and M/N ratio of the 1 kHz multiple
- Default input reference selection
- Reference selection Priority
- Automatic or manual reference switching
- Glitch-less or hit-less reference switching
- Reference switch based on single cycle monitor or coarse frequency monitor or guard soak timer

#### 5.3.2 DPLL Configuration and Programmability

The following is the set of parameters that are configurable:

.

- Number of active DPLLs
- DPLL input reference
- DPLL loop bandwidth

### **5.3.3 Output Multiplexer Configuration and Programmability**

The following is the set of parameters that are configurable:

- Output multiplexer configuration
- Start or Stop clock

### 5.3.4 Synthesis Macro Configuration and Programmability

The following is the set of parameters that are configurable:

- Synthesis Macro locked to DPLL0, DPLL1, freerun or disabled
- Synthesis Macro mode M/N ratio or 1 kHz multiple
- Synthesis Macro high speed output clock, defined as a 1 kHz multiple and 1 kHz multiple with M/N ratio

### 5.3.5 Output Dividers and Skew Management Configuration and Programmability

The following is the set of parameters that are configurable:

- Post divider enable/disable
- Divider ratio
- Output delay value

### 5.3.6 Output Drivers Configuration and Programmability

The following is the set of parameters that are configurable:

- Output driver Enable/Disable
  - Output driver mode (single ended or differential)
  - Single ended driver slew rate control (slow, medium and fast)
  - Differential driver mode (LVPECL, LVDS, HCSL)

## 5.4 State Control and Reference Switch Modes

The device has two main control modes of operation: un-managed mode and managed mode.

In un-managed mode of operation, the DPLL state (normal, freerun and holdover) and the selected reference is automatically set by the device internal state machine. It is based on availability of a valid reference and on the reference selection priority.

In managed mode of operation, the DPLL state (normal, freerun and holdover) and the selected reference is manually set by the user.

The device allows for smooth transition from in and out of the two modes of operation. Hence if the DPLL was in managed mode and locked to ref2 reference and it was switched to un-managed mode of operation, then the state machine continues managing the device starting from being locked to the ref2 reference and it will not force reference switching to any other reference unless a change in conditions required such transition.

To facilitate monitoring and managing the device during managed mode of operation, and to facilitate monitoring the device during the un-managed mode, some control and status bits can be muxed into the GPIO pins. The following is a list for such control and monitor bits:

- DPLL state (2 control bits), Normal, holdover and freerun
- DPLL reference selection (2 control and 2 status bits)
- DPLL reference switching mode (1 control bit) (tie\_clr\_b) hit-less and glitch-less
- Reference monitoring (3 status bits)
- DPLL holdover indication (1 status bit)
- DPLL lock indication (1 status bit)

Each DPLL has its own independent state control and reference selection state machine.

### 5.4.1 Un-managed Mode

The un-managed mode combines the functionality of the normal state with automatic holdover and automatic reference switching. In this mode, transitioning from one mode to the other is controlled by the device internal state machine.

The on-chip state machine monitors the device status bits, and based on the status information the state machine makes a decision to force holdover or to perform reference switch.

In the un-managed mode of operation, the device internal state machine manages the device operating states. The reference switching state machine is based on the internal clock monitoring of each of the available input clock sources and the reference priority.

The state machine selects a reference source based on its priority value defined in a control register and the current availability of the reference. If all the references are available, the reference with the highest priority is selected; if this reference fails, the next highest priority reference is selected, and so on.

In un-managed mode, the state machine only reacts to failure indicators and performs reference switching if either one of the following conditions takes place and they are not masked with their corresponding mask bits as follows:

- LOS detected a failure and RefSwMask<0> is at logic “1”
- SCM detected a failure and RefSwMask<1> is at logic “1”
- CFM detected a failure and RefSwMask<2> is at logic “1”
- The Guard Soak Time is triggered and RefSwMask<3> is at logic “1”

The default conditions is RefSwMask<3:0> “1000”.

In un-managed mode of operation, the state machine only reacts to failure indicators and goes into auto-holdover under one of the following conditions if they are not masked with their corresponding mask bits:

- LOS detected a failure and HOMask<0> is at logic “1”
- SCM detected a failure and HOMask<1> is at logic “1”
- CFM detected a failure and HOMask<2> is at logic “1”
- The Guard Soak Time is triggered and HOMask<3> is at logic “1”
- Reference switch condition exist, and no reference is available

The default conditions is HOMask<3:0> is “0111”.

In un-managed mode of operation, the state machine automatically recovers from auto-holdover when the conditions to enter auto-holdover are not present.

In un-managed mode, the device automatically selects a valid reference input. If the current reference used for synchronization fails, the state machine switches to the other available reference. If all the available references fail, then the device enters the Holdover mode without switching to another reference. The selection is based on reference priority. Active reference is shown by reference selection status bits.

## Reference Priority

Every reference has 3 bits in a control register associated with its priority value (0 to 3) to allow system designers to program the priority of the input references. The priorities are relative to each other, with lower value numbers being the higher priority. value "111" disables the ability to select the reference (i.e., mark reference: don't use for synchronization). If two or more inputs are given the same priority number, the input is selected based on the reference naming convention (i.e., ref0 is higher priority than ref1). The default reference selection priority is based on reference number (i.e., ref0 is highest priority and ref3 is the lowest priority).

When two references have the same priority they will not revert to each other (as reference availability change), but they will revert to a reference with a higher priority when it is available.

### 5.4.2 Managed Mode

The managed mode combines the functionality of the Holdover, Freerun and Normal states with automatic Holdover, and manual reference switching through bits in the control registers. In this mode, transitioning from one state to the other is controlled by an external controller.

The external controller monitors the device status bits. Based on the status information, the external controller makes a decision to force holdover or to perform reference switch. In managed mode of reference selection, the active reference input is selected based on reference selection control bits. If the external controller sets the device to lock to a failed reference, the device stays in auto-holdover and only switches to that reference if it becomes valid.

The state machine only reacts to failure indicators and goes into auto-holdover under one of the following conditions if they are not masked with their corresponding mask bits:

- LOS detected a failure and HOMask<0> is at logic "1"
- SCM detected a failure and HOMask<1> is at logic "1"
- CFM detected a failure and HOMask<2> is at logic "1"
- The Guard Soak Time is triggered and HOMask<3> is at logic "1"

The default conditions HOMask<3:0> is "0111".

The state machine automatically recovers from auto-holdover when the conditions to enter auto-holdover are not present.

Time critical state transitions for entry into auto-holdover and exit from auto-holdover are managed by the internal state machine. Such transition into and out of the auto-holdover state will not allow for change of reference, unless forced by reference selection control bits. A change on the reference select bits triggers an internal state transition into auto-holdover and then exit into Normal state and locking to the new reference.

## 6.0 Host Interface

A host processor controls and receives status from the Microsemi device using either a SPI or an I<sup>2</sup>C interface. The type of interface is selected using the startup state of the GPIO pins.

**Figure 20 - Serial Interface Configuration**

The selection between I2C and SPI interfaces is performed at start-up using GPIO[3] pin, right after pwr\_b gets de-asserted. The GPIO pin need to be held at their appropriate value for 50 ms after the de-assertion of pwr\_b, after which time they can be released and used as any other GPIO.

Both interfaces use seven bit address field and the device has eight bit address space. Hence, memory is divided in two pages. Page 0 with addresses 0x00 to 0x7E and Page 1 with addresses 0x80 to 0xFF. Writing 0x01 to Page Register at address 0x7F, toggles SPI/I2C accesses between Page 0 and Page 1.

GPIO[3]	Serial Interface
0	SPI
1	I2C

**Table 6 - Serial Interface Selection**

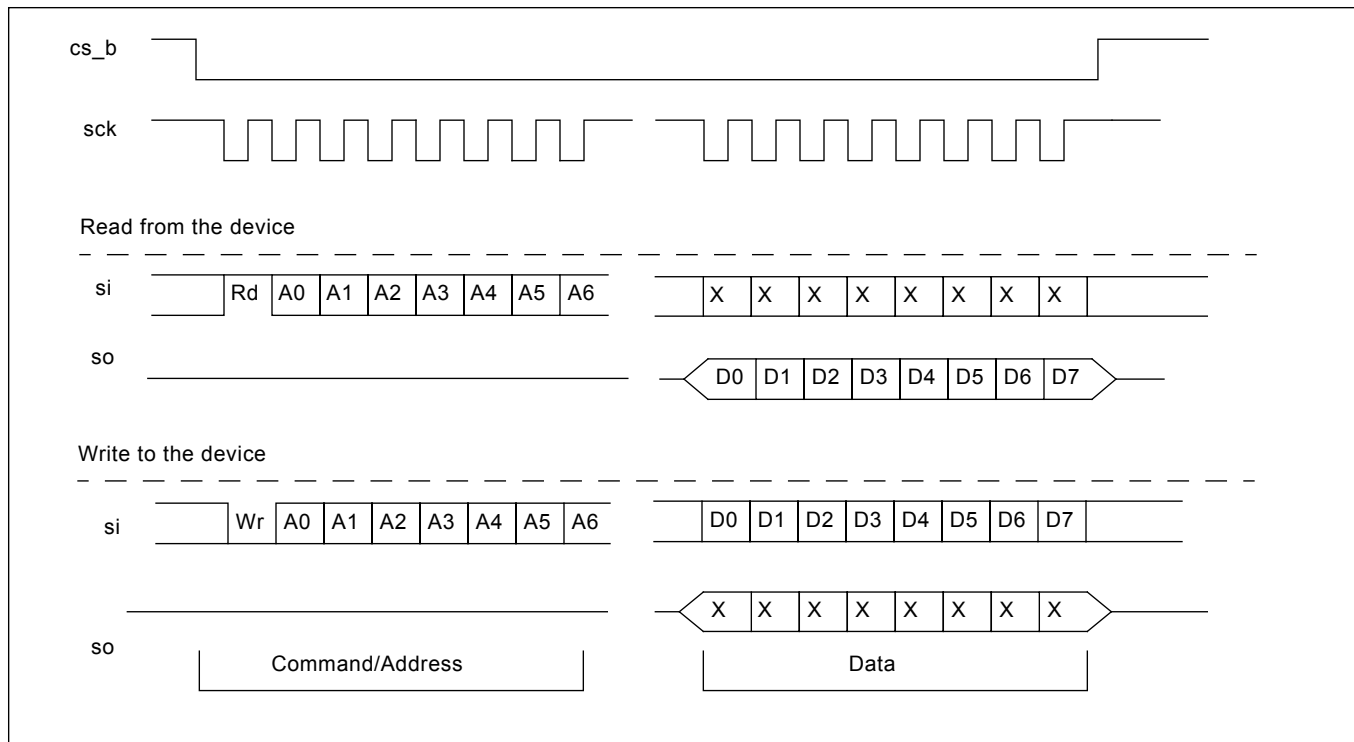

### 6.1 Serial Peripheral Interface

The serial peripheral interface (SPI) allows read/write access to the registers that are used to configure, read status, and allow manual control of the device.

This interface supports two modes of access: Most Significant Bit (MSB) first transmission or Least Significant Bit (LSB) first transmission. The mode is automatically selected based on the state of **sck\_scl** pin when the **cs\_b\_asel0** pin is active. If the **sck\_scl** pin is low during **cs\_b\_asel0** activation, then MSB first timing is selected. If the **sck\_scl** pin is high during **cs\_b\_asel0** activation, then LSB first timing is assumed.

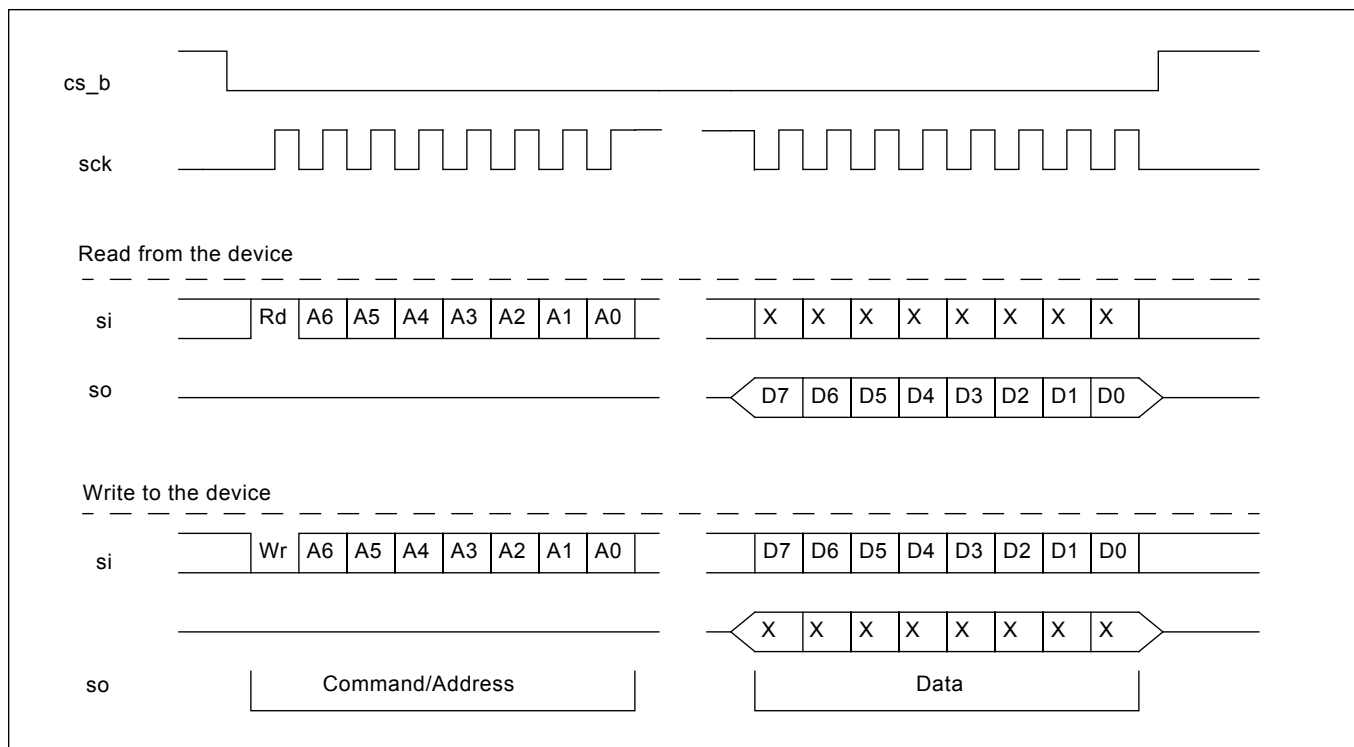

The serial peripheral interface supports half-duplex processor mode which means that during a write cycle to the device, output data from the **so\_asel1** pin must be ignored. Similarly, the input data on the **si\_sda** pin is ignored by the device during a read cycle.

### 6.1.1 Least Significant Bit (LSB) First Transmission Mode

**Figure 21 - Serial Peripheral Interface Functional Waveforms - LSB First Mode**

### 6.1.2 Most Significant Bit (MSB) First Transmission Mode

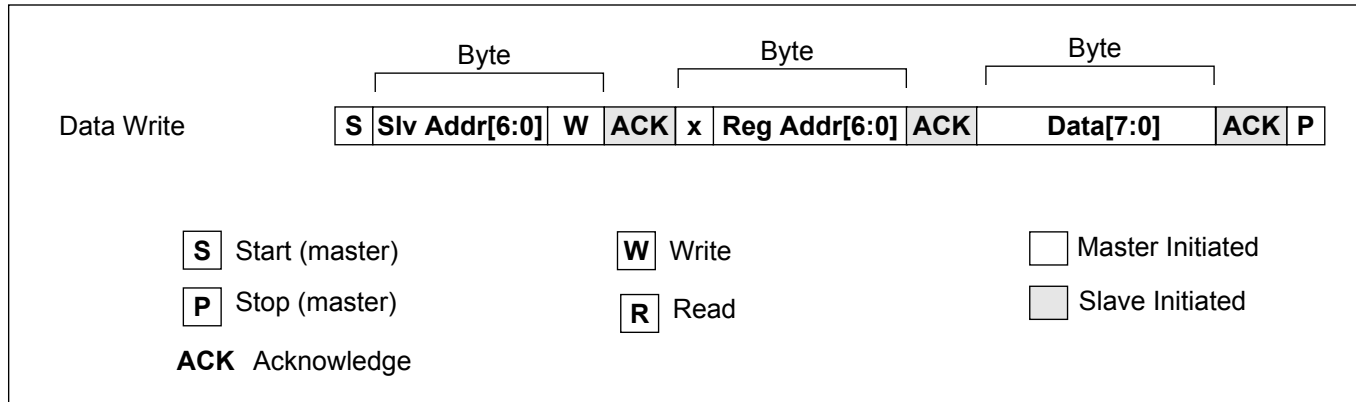

**Figure 22 - Serial Peripheral Interface Functional Waveforms - MSB First Mode**

### 6.1.3 I<sup>2</sup>C Interface

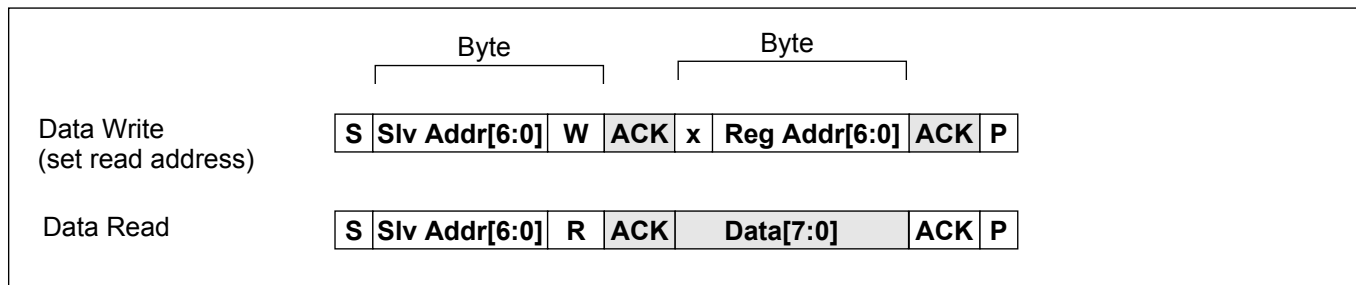

The I<sup>2</sup>C controller supports version 2.1 (January 2000) of the Philips I<sup>2</sup>C bus specification. The port operates in slave mode with 7-bit addressing, and can operate in Standard (100 kbits/s) and Fast (400 kbits/s) mode. Burst mode is supported in both standard and fast modes.

Data is transferred MSB first and occurs in 1 byte blocks. As shown in Figure 23, a **write** command consists of a 7-bit device (slave) address, a 7-bit register address (0x00 - 0x7F), and 8-bits of data.

**Figure 23 - I<sup>2</sup>C Data Write Protocol**

A **read** is performed in two stages. A data write is used to set the register address, then a data read is performed to retrieve the data from the set address. This is shown in Figure 24.

**Figure 24 - I<sup>2</sup>C Data Read Protocol**

The **7-bit device (slave) address** contains a 5-bit fixed address plus variable bits which are set with the **asel0**, and **asel1** pins. This allows multiple ZL30157s to share the same I<sup>2</sup>C bus. The address configuration is shown in Figure 25.

**Figure 25 - I<sup>2</sup>C 7-bit Slave Address**

The device also supports burst mode which allows multiple data write or read operations with a single specified address. This is shown in Figure 26 (write) and Figure 27 (read). The first data byte is written/read from the specified address, and subsequent data bytes are written/read using an automatically increment address. The maximum auto increment address of a burst operation is 0x7F. Any operations beyond this limit will be ignored. In other words, the auto increment address does not wrap around to 0x00 after reaching 0x7F.

#### Data Write (Burst Mode)

**Figure 26 - I<sup>2</sup>C Data Write Burst Mode**

#### Data Write (Set first read address)

#### Data Read (Burst Mode)

**Figure 27 - I<sup>2</sup>C Data Read Burst Mode**

## 7.0 Register Map

The device is mainly controlled by accessing software registers through the serial interface (SPI or I<sup>2</sup>C). The device can be configured to operate in a highly automated manner which minimizes its interaction with the system's processor, or it can operate in a manual mode where the system processor controls most of the operation of the device.

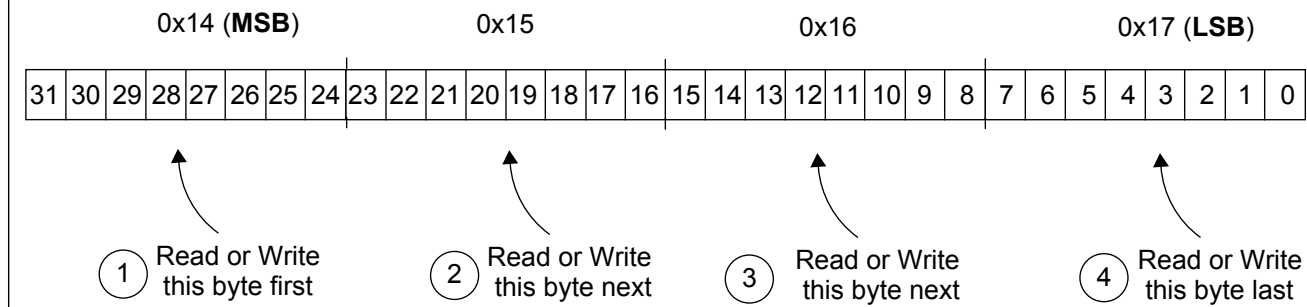

**The simplest way to generate appropriate configuration for the device is to use the evaluation board GUI which can operate standalone (without the board). With GUI user can quickly set all required parameters and save the configuration to a text file.**

### Multi-byte Register Values

The device register map is based on 8-bit register access, so register values that require more than 8 bits must be spread out over multiple registers and accessed in 8-bit segments. When accessing multi-byte register values, it is important that the registers are accessed in the proper order—they must follow big endian addressing scheme. The 8-bit register containing the most significant byte (MSB) must be accessed first, and the register containing the least significant byte (LSB) must be accessed last. An example of a multi-byte register is shown in Figure 28. When writing a multi-byte value, the value is latched when the LSB is written.

#### Example:

The programmable input reference M and N 16 bit values defining the M/N ratio is programmed using a 32-bit value which is spread over four 8-bit registers. The MSB is contained in address 0x14 and the LSB in 0x17. When reading or writing this multi-byte value, the MSB must be accessed first, followed by the middle bytes, and the LSB last.

**Figure 28 - Accessing Multi-byte Register Values**

To assist in device setup, a configuration GUI is provided. The configuration GUI can directly configure the device evaluation board, but it also functions as a tool to provide details on how to configure different device registers.

### Procedure for writing registers

The procedure for updating the control registers in the ZL30157 is as follows:

- write 0x01 to Sticky\_R\_Lock Register at address 0x0D
- write to one or more ZL30157 control register(s)
- write 0x00 to Sticky\_R\_Lock Register at address 0x0D

When changing the dpll\_n\_mode bits[1:0] in the dpll\_n\_mode\_refsel registers (0x33,0x38) from '11' (automatic mode) to '10' (forced reference lock mode), the following procedure should be followed:

- write 0x01 to Sticky\_R\_Lock Register at address 0x0D
- write to one or more ZL30157 control register(s)\*
- wait 12ms
- write 0x00 to Sticky\_R\_Lock Register at address 0x0D

\* includes changing the dpll\_n\_mode bits[1:0] (from '11' to '10') in one or more of the DPLL\_n\_mode\_refsel registers.

**Time between two write accesses to the same register**

User should wait at least 12ms between two write accesses to the same register. For page register at address 0x7F, Sticky\_r\_lock register at address 0x0D, there is no wait time required between two accesses.

**Reading from Sticky Read (StickyR) Registers**

Access to some status registers is defined as Sticky Read (StickyR). Procedure for accessing these registers is:

- write 0x01 to StickyR Lock Register at address 0x0D
- clear status register(s) by writing 0x00 to it
- write 0x00 to StickyR Lock Register at address 0x0D
- wait for 12 ms
- read the status register(s)

The following table provides a summary of the registers available for status updates and configuration of the device. Devices with a custom OTP configuration will power-up with the custom configuration values instead of the default values.

Reg_Addr (Hex)	Register Name	Default Value (Hex)	Description	Type
<b>Miscellaneous Registers</b>				
0x00	id_reg	See Descript ion	Chip ID and version identification. User should not write to this register. If this register is written to, the default value will be temporarily overwritten until the next reset. The temporary change of the default value will not affect the performance of the device.	R/W
<b>Interrupts and Reference Monitor</b>				
0x02	ref_fail_isr_status	0x00	Reference failure status register	StickyR
0x03	dpll_isr_status	0x00	DPLL status register for DPLL0, 1, 2, 3:	StickyR
0x04	ref_fail_isr_mask	0x00	Reference failure interrupt service register mask	R/W
0x05	dpll_isr_mask	0x00	DPLL interrupt service register mask	R/W
0x06	ref_mon_fail_3_2	0x00	Ref3 and Ref2 failure indications	StickyR
0x07	ref_mon_fail_1_0	0x00	Ref1 and Ref0 failure indications	StickyR
0x08	ref_mon_fail_mask_3_2	0x66	Control register to mask each failure indicator for Ref3 and Ref2	R/W
0x09	ref_mon_fail_mask_1_0	0x66	Control register to mask each failure indicator for Ref1 and Ref0	R/W
0x0A	ref_config	0x10	Configures input references to be differential or single-ended	R/W
0x0B	gst_disqualif_time	0xAA	Control register for the guard soak timer disqualification time for the references	R/W
0x0C	gst_qualif_time	0x55	Control register for the guard soak timer qualification time for the references	R/W
0x0D	sticky_r_lock	0x00	Used to lock StickyR Status Registers from being updated by internal device logic	R/W
<b>Input Frequency Configuration</b>				
0x10:0x11	ref0_base_freq	0x9C40	Ref0 base frequency in Hz (16 bits, unsigned integer)	R/W

**Table 7 - Register Map**

Reg_Addr (Hex)	Register Name	Default Value (Hex)	Description	Type
0x12: 0x13	ref0_freq_multiple	0x0F30	Ref0 frequency as a multiple of the base frequency (16 bits, unsigned integer)	R/W
0x14:0x17	ref0_ratio_M_N	0x00010 001	Ref0 Mr and Nr values, used for multiplication ratio Mr/Nr (2 x 16 bits unsigned integers)	R/W
0x18:0x19	ref1_base_freq	0x9C40	Ref1 base frequency in Hz (16 bits, unsigned integer)	R/W
0x1A: 0x1B	ref1_freq_multiple	0x01E6	Ref1 frequency as a multiple of the base frequency (16 bits, unsigned integer)	R/W
0x1C:0x1F	ref1_ratio_M_N	0x00010 001	Ref1 Mr and Nr values, used for multiplication ratio Mr/Nr (2 x 16 bits unsigned integers)	R/W
0x20:0x21	ref2_base_freq	0x9C40	Ref2 base frequency in Hz (16 bits, unsigned integer)	R/W
0x22: 0x23	ref2_freq_multiple	0x01E6	Ref3 frequency as a multiple of the base frequency (16 bits, unsigned integer)	R/W
0x24:0x27	ref2_ratio_M_N	0x00010 001	Ref2 Mr and Nr values, used for multiplication ratio Mr/Nr (2 x 16 bits unsigned integers)	R/W
0x28:0x29	ref3_base_freq	0x9C40	Ref3 base frequency in Hz (16 bits, unsigned integer)	R/W
0x2A: 0x2B	ref3_freq_multiple	0x01E6	Ref3 frequency as a multiple of the base frequency (16 bits, unsigned integer)	R/W
0x2C:0x2F	ref3_ratio_M_N	0x00010 001	Ref3 Mr and Nr values, used for multiplication ratio Mr/Nr (2 x 16 bits unsigned integers)	R/W
<b>DPLL Configuration, State Machine Control and Monitor</b>				
0x30	dpll0_ctrl	0x0D	DPLL0 control register	R/W
0x31	dpll0_ref_priority3_2	0x32	DPLL0 reference 3 and 2 selection priority	R/W
0x32	dpll0_ref_priority1_0	0x10	DPLL0 reference 2 and 1 selection priority	R/W
0x33	dpll0_mode_refsel	0x03	DPLL0 reference selection control or reference selection status	R/W

Table 7 - Register Map (continued)

Reg_Addr (Hex)	Register Name	Default Value (Hex)	Description	Type
0x34	dpll0_ref_fail_mask	0x87	Control register to mask each failure indicator (SCM, CFM, PFM and GST) used for automatic reference switching and automatic holdover	R/W
0x35	dpll1_ctrl	0x0D	DPLL1 control register	R/W
0x36	dpll1_ref_priority3_2	0x32	DPLL1 reference 3 and 2 selection priority	R/W
0x37	dpll1_ref_priority1_0	0x10	DPLL1 reference 2 and 1 selection priority	R/W
0x38	dpll1_mode_refsel	0x03	DPLL1 reference selection or reference selection status	R/W
0x39	dpll1_ref_fail_mask	0x87	Control register to mask each failure indicator (SCM, CFM, PFM and GST) used for automatic reference switching and automatic holdover	R/W
0x44	dpll_hold_lock_fail	0x00	DPLLs lock and holdover status	StickyR
0x45	ex_fb_ctrl	0x00	External feedback control	R/W
0x46	reduced_diff_out_pwr	0xFF	Enables reduced power on high performance differential outputs	R/W
<b>Input Reference Monitoring Registers</b>				
0x47	phase_mem_limit_ref0	0x02	Reference 0 phase memory limit	R/W
0x48	phase_mem_limit_ref1	0x02	Reference 1 phase memory limit	R/W
0x49	phase_mem_limit_ref2	0x02	Reference 2 phase memory limit	R/W
0x4A	phase_mem_limit_ref3	0x02	Reference 3 phase memory limit	R/W
0x4B	scm_cfm_limit_ref0	0x55	Reference 0 single cycle monitor (SCM) and coarse frequency monitor (CFM) limits	R/W
0x4C	scm_cfm_limit_ref1	0x55	Reference 1 single cycle monitor (SCM) and coarse frequency monitor (CFM) limits	R/W
0x4D	scm_cfm_limit_ref2	0x55	Reference 2 single cycle monitor (SCM) and coarse frequency monitor (CFM) limits	R/W
0x4E	scm_cfm_limit_ref3	0x55	Reference 3 single cycle monitor (SCM) and coarse frequency monitor (CFM) limits	R/W
0x4F	dpll_config	0xF2	Selects which DPLLs are active	R/W

Table 7 - Register Map (continued)

Reg_Addr (Hex)	Register Name	Default Value (Hex)	Description	Type
<b>Output Synthesizer Configuration Registers</b>				
0x50:0x51	synth0_base_freq	0x9C40	Synthesizer 0 base frequency	R/W
0x52:0x53	synth0_freq_multiple	0x0798	Synthesizer 0 base frequency multiplication number	R/W
0x54:0x57	synth0_ratio_M_N	0x00010001	Specifies numerator Ms and denominator Ns for synthesizer 0 multiplication ratio Ms/Ns	R/W

## 8.0 Detailed Register Map

Register_Address: <b>0x00</b> Register Name: <b>id_reg</b> Default Value: <b>See Description</b> Type: R/W		
Bit Field	Function Name	Description
4:0	chip_id	Chip Identification = 0b00111
6:5	chip_revision	Chip revision number = 0b00 (full chip revision = chip_revision_2 bits in register 0xC6 and chip_revision bits[6:5] in register 0x00)
7	ready_indication	After reset this bit goes high when device is ready. This signals that user can start to program/configure the device. It can take up to 50 ms for this bit to go high after the reset. This bit should not be polled until 40ms after reset.

Register_Address: <b>0x02</b> Register Name: <b>ref_fail_isr_status</b> Default Value: <b>0x00</b> Type: StickyR		
Bit Field	Function Name	Description
0	ref0_fail	This bit is set to 1 when ref0 has a failure. The device will set this bit to high when ref0_fail_mask bit of the ref_fail_isr_mask register at address 0x04 is high and conditions for ref0 failure are satisfied. When this bit is set to high, it also sets IRQ line to high.
1	ref1_fail	Same description as for ref0
2	ref2_fail	Same description as for ref0
3	ref3_fail	Same description as for ref0
7:4	reserved	Leave as default

Register\_Address: **0x03**  
 Register Name: **dp1l\_isr\_status**  
 Default Value: **0x00**  
 Type: StickyR

Bit Field	Function Name	Description
0	dp1l0_holdover	The device will set this bit to high when dp1l0_holdover_mask bit of the dp1l_interrupt_mask register at address 0x05 is high and DPLL0 went into holdover mode. When this bit is set to high, it also sets IRQ line to high.
1	dp1l0_loss_of_lock	The device will set this bit to high when 'dp1l0_loss_of_lock_mask bit of the dp1l_interrupt_mask register at address 0x05 is high and DPLL0 has lost lock. When this bit is set to high, it also sets IRQ line to high.
2	dp1l1_holdover	Same description as above but for dp1l1
3	dp1l1_loss_of_lock	Same description as above but for dp1l1
7:4	reserved	Leave as default

Register\_Address: **0x04**  
 Register Name: **ref\_fail\_isr\_mask**  
 Default Value: **0x00**  
 Type: R/W

Bit Field	Function Name	Description
0	ref0_fail_isr_mask	Reference 0 failure interrupt generation mask. When set to zero disables interrupt generation and appearance in the Reference Status ISR register.
1	ref1_fail_isr_mask	Same description as above but for ref1.
2	ref2_fail_isr_mask	Same description as above but for ref2.
3	ref3_fail_isr_mask	Same description as above but for ref3.
7:4	reserved	Leave as default.

Register\_Address: **0x05**  
 Register Name: **dpll\_isr\_mask**  
 Default Value: **0x00**  
 Type: R/W

Bit Field	Function Name	Description
0	dpll0_holdover_mask	DPLL0 holdover indication mask. When set to zero disables interrupt generation and appearance in the DPLL Status ISR register.
1	dpll0_loss_of_lock_mask	DPLL0 loss of lock indication mask. When set to zero disables interrupt generation and appearance in the DPLL Status ISR register.
2	dpll1_holdover_mask	Same description as above but for dpll.1
3	dpll1_loss_of_lock_mask	Same description as above but for dpll1.
7:4	reserved	Leave as default.

Register\_Address: **0x06**  
 Register Name: **ref\_mon\_fail\_3\_2**  
 Default Value: **0x00**  
 Type: StickyR

Bit Field	Function Name	Description
0	ref2_fail_los	Reference 2 Loss Of Signal (LOS) indicator. The device will set this bit to high when external Ref 2 LOS signal (typically from PHY device), applied to selected GPIO, goes high. The Ref2 LOS signal indicator can be associated with any of available GPIOs pins through the 'GPIO function' registers. <b>Note:</b> this bit is not maskable.
1	ref2_fail_scm	Reference 2 Single Cycle Monitor (SCM) indicator. This bit is set high whenever Single Cycle Failure on Reference 2 occurs. <b>Note:</b> this bit is not maskable.
2	ref2_fail_cfm	Reference 2 coarse frequency monitoring (SCM) indicator. This bit is set high whenever coarse frequency monitoring failure on Reference 2 occurs. <b>Note:</b> this bit is not maskable.
3	ref2_fail_gst	Guard Soak Timer (GST) failure indicator on Reference 2. This bit is set high whenever Reference 2 guard soak timer expires. <b>Note:</b> this bit is not maskable.
4	ref3_fail_los	Same description as above but for ref3.
5	ref3_fail_scm	Same description as above but for ref3.
6	ref3_fail_cfm	Same description as above but for ref3.

Register\_Address: **0x06**  
 Register Name: **ref\_mon\_fail\_3\_2**  
 Default Value: **0x00**  
 Type: StickyR

Bit Field	Function Name	Description
7	ref3_fail_gst	Same description as above but for ref3.

Register\_Address: **0x07**  
 Register Name: **ref\_mon\_fail\_1\_0**  
 Default Value: **0x00**  
 Type: StickyR

Bit Field	Function Name	Description
0	ref0_fail_los	Reference 0 Loss Of Signal (LOS) indicator. The device will set this bit to high when external Ref 0 LOS signal (typically from PHY device), applied to selected GPIO, goes high. The Ref0 LOS signal indicator can be associated with any of available GPIOs pins through the 'GPIO function' registers. <b>Note:</b> this bit is not maskable.
1	ref0_fail_scm	Reference 0 Single Cycle Monitor (SCM) indicator. This bit is set high whenever Single Cycle Failure on Reference 0 occurs. <b>Note:</b> this bit is not maskable.
2	ref0_fail_cfm	Reference 0 coarse frequency monitoring (SCM) indicator. This bit is set high whenever coarse frequency monitoring failure on Reference 0 occurs. <b>Note:</b> this bit is not maskable.
3	ref0_fail_gst	Guard Soak Timer (GST) failure indicator on Reference 0. This bit is set high whenever Reference 0 guard soak timer expires. <b>Note:</b> this bit is not maskable.
4	ref1_fail_los	Same description as above but for ref1.
5	ref1_fail_scm	Same description as above but for ref1.
6	ref1_fail_cfm	Same description as above but for ref1.
7	ref1_fail_gst	Same description as above but for ref1.

Register\_Address: **0x08**Register Name: **ref\_mon\_fail\_mask\_3\_2**Default Value: **0x66**

Type: R/W

Bit Field	Function Name	Description
3:0	ref2_fail_mask	<p>Masks failure indicators (LOS,SCM, CFM, and GST) for reference 2.</p> <p>bit 0: LOS (Loss of Clock)  bit 1: SCM (Single Cycle Monitor)  bit 2: CFM (Coarse Frequency Monitor)  bit 3: GST (Guard Soak Timer)</p> <p>0: failure bit is masked (disabled)  1: failure bit is un-masked (enabled)</p> <p>Note: When set low these bits will mask corresponding Reference 2 failure indicators in Reference Failure Interrupt Status Register at address 0x02. They will not affect bits in Reference Monitoring Failure Mask Register at address 0x06 because bits in Reference Monitoring Failure Mask Register are not maskable.</p>
7:4	ref3_fail_mask	Same description as above but for ref3

Register\_Address: **0x09**Register Name: **ref\_mon\_fail\_mask\_1\_0**Default Value: **0x66**

Type: R/W

Bit Field	Function Name	Description
3:0	ref0_fail_mask	<p>Masks failure indicators (LOS,SCM, CFM, and GST) for reference 0.</p> <p>bit 0: LOS (Loss of Clock)  bit 1: SCM (Single Cycle Monitor)  bit 2: CFM (Coarse Frequency Monitor)  bit 3: GST (Guard Soak Timer)</p> <p>0: failure bit is masked (disabled)  1: failure bit is un-masked (enabled)</p> <p>Note: When set low these bits will mask corresponding Reference 0 failure indicators in Reference Failure Interrupt Status Register at address 0x02. They will not affect bits in Reference Monitoring Failure Mask Register at address 0x07 because bits in Reference Monitoring Failure Mask Register are not maskable.</p>
7:4	ref1_fail_mask	Same description as above but for ref1.

Register\_Address: **0x0A**  
 Register Name: **ref\_config**  
 Default Value: **0x10**  
 Type: R/W

Bit Field	Function Name	Description
0	ref0_pre-divider_enable	When set high, the Reference 0 input clock will be divided by 2 prior to being fed to DPLL. All registers, which require frequency of the Reference 0 will have to be programmed with half of Reference 0 frequency. When set low, the Reference 0 is fed directly to DPLL.
1	ref1_pre-divider_enable	Same description as above but for ref1
2	ref2_pre-divider_enable	Same description as above but for ref2
3	ref3_pre-divider_enable	Same description as above but for ref3
4	ref0_diff_input_enable	When set high, the device expects differential clock at Ref 0 input pins (Ref0_P and Ref0_N). When set low, the device expects single-ended clock at Ref0_P input pin, and Ref0_N input should be connected to ground.
5	ref1_diff_input_enable	Same description as above but for ref1
6	ref2_diff_input_enable	Same description as above but for ref2
7	ref3_diff_input_enable	Same description as above but for ref3

Register\_Address: **0x0B**  
 Register Name: **gst\_disqualif\_time**  
 Default Value: **0xAA**  
 Type: R/W

Bit Field	Function Name	Description
1:0	ref0_gst_disqualif_timer	Selects time to disqualify input reference after detection of either the Ref 0 CFM or Ref 0 SCM indicators.  00: minimum delay 01: 10 ms 10: 50 ms (default) 11: 2.5 s
3:2	ref1_gst_disqualif_timer	Same description as above but for ref1
5:4	ref2_gst_disqualif_timer	Same description as above but for ref2

Register\_Address: **0x0B**  
 Register Name: **gst\_disqualif\_time**  
 Default Value: **0xAA**  
 Type: R/W

Bit Field	Function Name	Description
7:6	ref3_gst_disqualif_timer	Same description as above but for ref3

Register\_Address: **0x0C**  
 Register Name: **gst\_qualif\_time**  
 Default Value: **0x55**  
 Type: R/W

Bit Field	Function Name	Description
1:0	ref0_gst_qualif_timer	Selects time to qualify input reference after deassertion of both the Ref 0 CFM and Ref 0 SCM indicators.  00: 2 x selected Ref0 GST disqualify time 01: 4 x selected Ref0 GST disqualify time (default) 10: 6 x selected Ref0 GST disqualify time 11: 8 x selected Ref0 GST disqualify time
3:2	ref1_gst_qualif_timer	Same description as above but for ref1
5:4	ref2_gst_qualif_timer	Same description as above but for ref2
7:6	ref3_gst_qualif_timer	Same description as above but for ref3

Register\_Address: **0x0D**  
 Register Name: **Sticky\_r\_lock**  
 Default Value: **0x00**  
 Type: R/W

Bit Field	Function Name	Description
7:0	sticky_r_lock	This register is used when accessing StickyR status registers. Writing 0x01 to this register locks the status register from being updated by internal logic. Writing 0x00 to this register enables internal updates of StickyR status registers Please refer to <b>Reading from Sticky Read (StickyR) registers</b> and <b>Procedure for writing registers</b> procedures at the beginning of 7.0, "Register Map" section.

Register\_Address: **0x10:0x11**  
 Register Name: **ref0\_base\_freq**  
 Default Value: **0x9C40**  
 Type: R/W

Bit Field	Function Name	Description
15:0	ref0_base_freq	<p>Unsigned binary value of these bits represents Ref0 base frequency Br in Hz. Values for Br that can be programmed:</p> <p>0x03E8 for 1 kHz,            0x07D0 for 2 kHz,            0x1388 for 5 kHz,            0x186A for 6.25 kHz,            0x1F40 for 8 kHz,            0x2710 for 10 kHz,            0x30D4 for 12.5 kHz,            0x61A8 for 25 kHz,            0x9C40 for 40 kHz.</p> <p><b>Note 1:</b> Other Br rates can be supported, please contact the CMPG application support team if another specific Br rate is required  <b>Note 2:</b> in order to write 16 bit value to this register (and any other register that is bigger than 8 bits), the most significant byte has to be written to the lower address and least significant byte has to be written to the higher address. Hence, memory mapping follows big endian.</p>

Bit Field	Function Name	Description
15:0	synth1_fec_ratio_denom_Ns	<p>Unsigned binary value of Ms bits, in combination with unsigned binary value of Ns bits represents Synthesizer1 FEC multiplication ratio. Synthesizer FEC frequencies are calculated using the following formula:</p> $\text{Synth\_freq [Hz]} = \text{Bs} \times \text{Ks} \times 8 \times \text{Ms} / \text{Ns}$ <p>For regular (non-FEC) synthesizer frequencies, Ms and Ns should be programmed to 0x0001 (default values)</p> <p>Examples of some synthesizer FEC frequencies and appropriate values that can be programmed for the Bs, Ks, Ms and Ns registers to get those FEC frequencies:</p> <p><b>a) OC-192 mode, standard EFEC for long reach:</b></p>
31:16	synth1_fec_ratio_numer_Ms	<p>Desired frequency: 155.52 MHz x 255 / 237  Synth frequency: 622.08MHz x 255/237  Base frequency Bs: 40 kHz (0x9C40)  Base freq. multiplier Ks: 1944 (0x0798)  FEC ratio numerator Ms: 255 (0x00FF)  FEC ratio denominator Ns: 237 (0x00ED)  Post div PA: 4</p> <p><b>b) Long reach 10GE mode, double rate conversion:</b></p> <p>Desired frequency: 156.25MHz x 66/64 x 255/238  Synth frequency: 625MHz x 66/64 x 255/238  Base frequency Bs: 25 kHz (0x061A8))  Base freq. multiplier Ks: 3125 (0x0C35)  FEC ratio numerator Ms: 66x255 (0x41BE)  FEC ratio denominator Ns: 64x238 (0x3B80)  Post div PA: 4</p>

Register\_Address: **0x70**Register Name: **output\_synth\_drive\_pll**Default Value: **0x10**Type: **R/W**

Bit Field	Function Name	Description
0	dpll_for_synth0	Selects which DPLL will drive Synthesizer 0.  0: DPLL0 1: DPLL1
1:3	reserved	Leave as default.
4	dpll_for_synth1	Same as above but for Synthesizer 1
7:5	reserved	Leave as default.

Register\_Address: **0x71**Register Name: **output\_synth\_en**Default Value: **0x01**Type: **R/W**

Bit Field	Function Name	Description
0	synth_en	Enables output of Synthesizer 0  0: disables synth0 output 1: enables synth0 output
1	reserved	Leave as default
2	synth_en	Enables output of Synthesizer 1  0: disables synth1 output 1: enables synth1 output
7:3	reserved	Leave as default

Register\_Address: **0x72**Register Name: **dp1l\_lock\_selection**Default Value: **0xAA**Type: **R/W**

Bit Field	Function Name	Description
1:0	dp1l0_lock_selection	Selects DPLL0 lock indicator status condition (appearing in the 'DPLL lock fail' register).  00: reserved 01: phase error is smaller than 1 us during 1 s 10: phase error is smaller than 10 us during 1 s 11: phase error is smaller than 10 us during 10 s
3:2	dp1l1_lock_selection	Same as above but for dp1l1
7:4	reserved	Leave as default

Register\_Address: **0x73:0x76**  
 Register Name: **central\_freq\_offset**  
 Default Value: **0x046AAAAB**  
 Type: **R/W**

Bit Field	Function Name	Description
31:0	central_freq_offset	<p>2's complement binary value of these bits represent central frequency offset for the device. This value should be used to compensate for oscillator inaccuracy, or make the device look like Numerically Controlled Oscillator (NCO). This register controls central frequency of all 4 Synthesizers.          Expressed in steps of <math>\pm 2^{-32}</math> of nominal setting.</p> <p>When oscillator inaccuracy is known: <math>\text{inacc\_osc} = (\text{f\_osc} - \text{f\_nom})/\text{f\_nom}</math> (usually specified in ppm), value to be programmed in this register is calculated as per the following formula:</p> <p><math>X = (1/(1 + \text{inacc\_osc}) - 1) \cdot 2^{32}</math>, when <math>\text{f\_osc} &lt; \text{f\_nom}</math>  <math>X = (1/(1 + \text{inacc\_osc})) \cdot 2^{32}</math>, when <math>\text{f\_osc} &gt; \text{f\_nom}</math>,          where <math>\text{inacc\_osc}</math> - represents oscillator frequency inaccuracy,  <math>\text{f\_osc}</math> - represents oscillator frequency, and  <math>\text{f\_nom}</math> - represents oscillator nominal frequency (i.e., 25 MHz, 20 MHz)</p> <p>Generally, when the oscillator frequency is lower than the nominal, frequency offset has to be programmed to compensate it in opposite direction, i.e. frequency offset has to be positive, and vice versa.</p> <p>Example 1): if oscillator inaccuracy is -2% (<math>\text{f\_osc} = 24.5 \text{ MHz}</math>; <math>\text{inacc\_osc} = (\text{f\_osc} - 25 \text{ MHz})/25\text{MHz} = -0.02</math>),  <math>X = (1/(1 + (-0.02)) - 1) \cdot 2^{32} = (1/0.98 - 1) \cdot 2^{32} = 87652394 = 0x0539782A</math></p> <p>Example 2): if oscillator inaccuracy is +2% (<math>\text{f\_osc} = 25.5 \text{ MHz}</math>; <math>\text{inacc\_osc} = (\text{f\_osc} - 25 \text{ MHz})/25\text{MHz} = 0.02</math>),  <math>X = (1/(1 + 0.02)) \cdot 2^{32} = (1/1.02) \cdot 2^{32} = 4210752251 = 0xFAFAFAFB</math></p> <p>When NCO behavior is desired, the output frequency should be calculated as per formula:  <math>\text{f}_{\text{out}} = (1 + X/2^{32}) \cdot \text{f}_{\text{init}}</math>          where X -represent 2's complement number specified in this register  <math>\text{f}_{\text{init}}</math> - initial frequency set by Bs, Ks, Ms, Ns and postdivider number for particular VCO  <math>\text{f}_{\text{out}}</math> - output frequency</p> <p><b>Note 1:</b> Nominal frequency for central frequency offset calculation is 25 MHz although master clock frequency is required to be 24.576 MHz. Because of this default value in this register is 0x046AAAAB.  <b>Note 2:</b> Central Frequency Offset should not exceed <math>\pm 5\%</math> off nominal.</p>

Register\_Address: **0x77**  
 Register Name: **synth1\_0\_filter\_sel**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
0	synth0_filter_select	Selects filter used by Synthesizer 0  0: external filter 1: internal filter
1	synth1_filter_select	Selects filter used by Synthesizer 1  0: external filter 1: internal filter
7:2	reserved	Leave as default

Register\_Address: **0x78**  
 Register Name: **synth0\_fine\_phase\_shift**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
7:0	syn0_fine_phase_shift	Unsigned binary value of these bits represent Synth0 fine phase shift (advancement) in steps of Synth0_period / 256.  <b>Note 1:</b> This register controls fine phase shift for all clocks coming out of the Synthesizer 0 (including all four postdividers)

Register\_Address: **0x7A**  
 Register Name: **synth1\_fine\_phase\_shift**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
7:0	syn1_fine_phase_shift	Unsigned binary value of these bits represent Synth0 fine phase shift (advancement) in steps of Synth1_period / 256.  <b>Note 1:</b> This register controls fine phase shift for all clocks coming out of the Synthesizer 1 (including all four postdividers)

Register\_Address: **0x7F**  
 Register Name: **page\_register**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
0	page_select	This register is used to toggle memory access between page 0 (addresses 0x00 to 0x7E) and page 1 (addresses 0x80 to 0xFF). This is required because SPI and I2C ports have only seven address bits and the device memory space is eight bit wide.  0: selects addresses 0x00 to 0x7E 1: selects addresses 0x80 to 0xFB
7:1	reserved	reserved

Register\_Address: **0x80:0x82**  
 Register Name: **synth0\_post\_div\_A**  
 Default Value: **0x000002**  
 Type: **R/W**

Bit Field	Function Name	Description
22:0	synth0_post_div_A	Unsigned binary value represents Synthesizer0 Post Divider value P0A. The Synthesizer0 frequency is divided by the P0A value before being fed to the selected output pins
23	reserved	This bit <b>must</b> be set to 0

Register\_Address: **0x83:0x85**  
 Register Name: **synth0\_post\_div\_B**  
 Default Value: **0x000002**  
 Type: **R/W**

Bit Field	Function Name	Description
22:0	synth0_post_div_B	Unsigned binary value represents Synthesizer0 Post Divider value P0B. The Synthesizer0 frequency is divided by the P0B value before being fed to the selected output pins
23	reserved	This bit <b>must</b> be set to 0

Register\_Address: **0x86:0x88**  
 Register Name: **synth0\_post\_div\_C**  
 Default Value: **0x000040**  
 Type: **R/W**

Bit Field	Function Name	Description
15:0	frm_pulse_period_or_div	<p>When bits 23:20 of this register are programmed to '1111', binary value of these bits represent number of periods of the selected related clock in between two frame pulses</p> <p>When bits 23:20 of this register are programmed to any other value, the appropriate output clock is selected to have a 'normal' 50% duty cycle clock, and binary value of these bits combined with other bits of this register creates postdivider ratio for the output clock (Synthesizer0 Post Divider value P0C). The Synthesizer0 VCO frequency is divided by the P0C value to get desired output clock frequency on selected output pins.</p> <p><b>Note:</b> The output clock duty-cycle may not be within specified 45% to 55% when post divider value P0C is an odd number and where frequency of the output clock is close to the maximum output frequency supported by hpoutclk. The worst case duty-cycle is 30% is when synthesizer frequency is set to 1 GHz and the P0C is set to 7. If duty-cycle of 45% to 55% is required, user can set synthesizer to run at 1GHz * 8/7 and P0C to 8 which will still generate the same frequency but within 45% to 55% duty-cycle.</p> <p>For odd P0C values greater than or equal to 41 ( 43, 45 ...) the duty-cycle will be within 45% to 55%.</p> <p>For even P0C values duty-cycle is always within 45% to 55%.</p>

Bit Field	Function Name	Description
15:0	frm_pulse_period_or_div	<p>When bits 23:20 of this register are programmed to '1111', binary value of these bits represent number of periods of the selected related clock in between two frame pulses.</p> <p>When bits 23:20 of this register are programmed to any other value, the appropriate output clock is selected to have a 'normal' 50% duty cycle clock, and binary value of these bits combined with other bits of this register creates postdivider ratio for the output clock (Synthesizer1 Post Divider value P2C). The Synthesizer1 VCO frequency is divided by the P2C value to get desired output clock frequency on selected output pins.</p> <p><b>Note:</b> The output clock duty-cycle may not be within specified 45% to 55% when post divider value P1C is an odd number and where frequency of the output clock is close to the maximum output frequency supported by hpoutclk. The worst case duty-cycle is 30% is when synthesizer frequency is set to 1 GHz and the P1C is set to 7. If duty-cycle of 45% to 55% is required, user can set synthesizer to run at 1GHz * 8/7 and P1C to 8 which will still generate the same frequency but within 45% to 55% duty-cycle.          For odd P1C values greater than or equal to 41 ( 43, 45 ...) the duty-cycle will be within 45% to 55%.          For even P1C values duty-cycle is always within 45% to 55%.</p>
17:16	frm_pulse_clk_sel_or_div	<p>When bits 23:20 of this register are programmed to '1111', these bits select related clock (postdivider) within the same synthesizer 1 (frame pulse width is equal to the related clock period):          00: clock 0 (Synth 1 postdivider A)          01: clock 1 (Synth 1 postdivider B)          10: reserved          11: clock 3 (Synth 1 postdivider D)</p> <p>When bits 23:20 of this register are programmed to any other value, the appropriate output clock is selected to have a 'normal' 50% duty cycle clock, and binary value of these bits combined with other bits of this register creates postdivider ratio for the output clock.</p> <p><b>Note:</b> It is forbidden for frame pulse to select 'itself' as its related clock.</p>

Register\_Address: **0x9E:0xA0**

 Type: **R/W**

Bit Field	Function Name	Description
12:0	phase_shift_s1_postdiv_a	2's complement binary value of these bits represent phase shift in steps of one period of Synthesizer1 frequency for all clocks coming from Synthesizer1 Post Divider A (0: no shift, -1: delay output clock for 1 period, 1: advance output clock for 1 period, and so on)

Register\_Address: **0xCB:0xCC**  
 Register Name: **phase\_shift\_s1\_postdiv\_a**  
 Default Value: **0x0000**  
 Type: **R/W**

Bit Field	Function Name	Description
15:13	quad_shift_s1_postdiv_a	<p>These bits select quadrature phase shift (in 45 degrees step, from -135 to +135 degrees) for all clocks coming from Synthesizer1 Post Divider A.</p> <p>000: 0 degrees (no shift)            001: -45 degrees            010: -90 degrees            011: -135 degrees            100: -180 (or 180) degrees            101: 135 degrees            110: 90 degrees            111: 45 degrees</p>

Register\_Address: **0xCD:0xCE**  
 Register Name: **phase\_shift\_s1\_postdiv\_b**  
 Default Value: **0x0000**  
 Type: **R/W**

Bit Field	Function Name	Description
12:0	phase_shift_s1_postdiv_b	<p>2's complement binary value of these bits represent phase shift in steps of one period of Synthesizer1 frequency for all clocks coming from Synthesizer1 Post Divider B (0: no shift, -1: delay output clock for 1 period, 1: advance output clock for 1 period, and so on)</p>
15:13	quad_shift_s1_postdiv_b	<p>These bits select quadrature phase shift (in 45 degrees step, from -135 to +135 degrees) for all clocks coming from Synthesizer1 Post Divider B.</p> <p>000: 0 degrees (no shift)            001: -45 degrees            010: -90 degrees            011: -135 degrees            100: -180 (or 180) degrees            101: 135 degrees            110: 90 degrees            111: 45 degrees</p>

Register\_Address: **0xCF:0xD0**Register Name: **phase\_shift\_s1\_postdiv\_c**Default Value: **0x0000**Type: **R/W**

Bit Field	Function Name	Description
12:0	phase_shift_s1_postdiv_c	2's complement binary value of these bits represent phase shift in steps of one period of Synthesizer1 frequency for all clocks coming from Synthesizer1 Post Divider C (0: no shift, -1: delay output clock for 1 period, 1: advance output clock for 1 period, and so on)
15:13	quad_shift_s1_postdiv_c	These bits select quadrature phase shift (in 45 degrees step, from -135 to +135 degrees) for all clocks coming from Synthesizer1 Post Divider C.  000: 0 degrees (no shift) 001: -45 degrees 010: -90 degrees 011: -135 degrees 100: -180 (or 180) degrees 101: 135 degrees 110: 90 degrees 111: 45 degrees

Register\_Address: **0xD1:0xD2**Register Name: **phase\_shift\_s1\_postdiv\_d**Default Value: **0x0000**Type: **R/W**

Bit Field	Function Name	Description
12:0	phase_shift_s1_postdiv_d	2's complement binary value of these bits represent phase shift in steps of one period of Synthesizer1 frequency for all clocks coming from Synthesizer1 Post Divider D (0: no shift, -1: delay output clock for 1 period, 1: advance output clock for 1 period, and so on)
15:13	quad_shift_s1_postdiv_d	These bits select quadrature phase shift (in 45 degrees step, from -135 to +135 degrees) for all clocks coming from Synthesizer1 Post Divider D.  000: 0 degrees (no shift) 001: -45 degrees 010: -90 degrees 011: -135 degrees 100: -180 (or 180) degrees 101: 135 degrees 110: 90 degrees 111: 45 degrees

Register\_Address: **0xDB**  
 Register Name: **config\_output\_voltage**  
 Default Value: **0x0F**  
 Type: **R/W**

Bit Field	Function Name	Description
1:0	bank1_output_voltage	Based on provided voltage level to the configurable outputs bank 1 (outputs outclk3, outclk2, outclk1 and outclk0), customer must configure these bits to represent that voltage.  00: 1.5 V 01: 1.8 V 10: 2.5 V 11: 3.3 V  These values are used for appropriate configurable outputs slew rate calculation
3:2	bank2_output_voltage	Based on provided voltage level to the configurable outputs bank 2 (outputs outclk7, outclk6, outclk5 and outclk4), customer must configure these bits to represent that voltage.  00: 1.5 V 01: 1.8 V 10: 2.5 V 11: 3.3 V  These values are used for appropriate configurable outputs slew rate calculation
7:4	reserved	reserved

Register\_Address: **0xDC**  
 Register Name: **config\_output\_slew\_rate**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
0	slew_rate_outclk_1_0	Slew rate for outclk1 and outclk0.  0: medium 1: fast

Register\_Address: **0xDC**  
 Register Name: **config\_output\_slew\_rate**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
1	slew_rate_outclk_3_2	Same description as above but for slew_rate_outclk_3_2
2	slew_rate_outclk_5_4	Same description as above but for slew_rate_outclk_5_4
3	slew_rate_outclk_7_6	Same description as above but for slew_rate_outclk_7_6
7:4	reserved	Leave as default.

Register\_Address: **0xE0**  
 Register Name: **gpio\_function\_pin0**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin0_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO0 control or status select' bit. The control and status table consist of 128 bits each. Default: GPIO pin unused.
7	gpio_pin0_con_or_stat_sel	Selects whether GPIO0 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xE1**  
 Register Name: **gpio\_function\_pin1**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin1_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO1 control or status select' bit. The control and status table consist of 128 bits each. Default: GPIO pin unused.

Register\_Address: **0xE1**  
 Register Name: **gpio\_function\_pin1**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
7	gpio_pin1_con_or_stat_sel	Selects whether GPIO1 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xE2**  
 Register Name: **gpio\_function\_pin2**  
 Default Value: **0x60**  
 Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin2_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO2 control or status select' bit. The control and status table consist of 128 bits each. Default: hpdiffo enable.
7	gpio_pin2_con_or_stat_sel	Selects whether GPIO2 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xE3**  
 Register Name: **gpio\_function\_pin3**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin3_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO3 control or status select' bit. The control and status table consist of 128 bits each. Default: GPIO pin unused.
7	gpio_pin3_con_or_stat_sel	Selects whether GPIO3 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xE4**  
 Register Name: **gpio\_function\_pin4**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin4_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO4 control or status select' bit. The control and status table consist of 128 bits each. Default: GPIO pin unused.
7	gpio_pin4_con_or_stat_sel	Selects whether GPIO4 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xE5**  
 Register Name: **gpio\_function\_pin5**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin5_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO5 control or status select' bit. The control and status table consist of 128 bits each. Default: GPIO pin unused.
7	gpio_pin5_con_or_stat_sel	Selects whether GPIO5 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xE6**  
 Register Name: **gpio\_function\_pin6**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin6_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO6 control or status select' bit. The control and status table consist of 128 bits each. Default: GPIO pin unused.

Register\_Address: **0xE6**  
 Register Name: **gpio\_function\_pin6**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
7	gpio_pin6_con_or_stat_sel	Selects whether GPIO6 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xE7**  
 Register Name: **gpio\_function\_pin7**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin7_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO7 control or status select' bit. The control and status table consist of 128 bits each. Default: GPIO pin unused.
7	gpio_pin7_con_or_stat_sel	Selects whether GPIO7 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xE8**  
 Register Name: **gpio\_function\_pin8**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin8_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO8 control or status select' bit. The control and status table consist of 128 bits each. Default: GPIO pin unused.
7	gpio_pin8_con_or_stat_sel	Selects whether GPIO8 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xE9**  
Register Name: **gpio\_function\_pin9**  
Default Value: **0x00**  
Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin9_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO9 control or status select' bit. The control and status table consist of 128 bits each. Deafault:GPIO pin unused.
7	gpio_pin9_con_or_stat_sel	Selects whether GPIO9 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xEA**  
Register Name: **gpio\_function\_pin10**  
Default Value: **0x00**  
Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin10_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO10 control or status select' bit. The control and status table consist of 128 bits each. Deafault:GPIO pin unused.
7	gpio_pin10_con_or_stat_sel	Selects whether GPIO10 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xEB**  
Register Name: **gpio\_function\_pin11**  
Default Value: **0x00**  
Type: **R/W**

Bit Field	Function Name	Description
6:0	gpio_pin11_table_address	Unsigned binary value of these bits represents bit address in the control or status table, depending on 'GPIO11 control or status select' bit. The control and status table consist of 128 bits each. Deafault:GPIO pin unused.

Register\_Address: **0xEB**  
 Register Name: **gpio\_function\_pin11**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
7	gpio_pin11_con_or_stat_sel	Selects whether GPIO11 is input (control) pin or output (status) pin. Selection: 0 = control 1 = status

Register\_Address: **0xF7**  
 Register Name: **spurs\_suppression**  
 Default Value: **0x00**  
 Type: **R/W**

Bit Field	Function Name	Description
7:0	spurs_suppression	This register is used for spurs suppression. Depending on the synthesizer configuration GUI will generate recommended value. Please refer to GUI for recommended value that should be written to this register. When the spurs_suppression register is changed, the ZL30157 requires 200msec to reconfigure itself, no reads or writes to the device are permitted during this reconfiguration period. The spurs_suppression register should only be written with values recommended by the GUI and it should only be written if a 24.576MHz master clock oscillator or crystal resonator is being used

## 9.0 AC and DC Electrical Characteristics

### Absolute Maximum Ratings\*

	Parameter	Symbol	Min.	Max.	Units
1	Supply voltage	$V_{DD\_R}$	-0.5	4.6	V
2	Core supply voltage	$V_{CORE\_R}$	-0.5	2.5	V
3	Voltage on any digital pin	$V_{PIN}$	-0.5	6	V
4	Voltage on osci and osco pin	$V_{OSC}$	-0.3	$V_{DD} + 0.3$	V
5	Storage temperature	$T_{ST}$	-55	125	°C

\* Exceeding these values may cause permanent damage. Functional operation under these conditions is not implied.

\* Voltages are with respect to ground (GND) unless otherwise stated

### Recommended Operating Conditions\*

	Characteristics	Sym	Min.	Typ.	Max.	Units
1	Supply voltage	$V_{DD\_IO}$ $AV_{DD}$	3.135	3.30	3.465	V
2	Core supply voltage	$V_{CORE}$	1.71	1.80	1.89	V
3	Operating temperature	$T_A$	-40	25	85	°C
4	Input voltage	$V_{DD\_IO}$	2.97	3.30	3.63	V
5	I/O Bank Supply Voltage	B1 $V_{DD\_IO}$ , B2 $V_{DD\_IO}$	1.425 1.71 2.375 3.135	1.5 1.8 2.5 3.3	1.575 1.89 2.625 3.465	V

\* Voltages are with respect to ground (GND) unless otherwise stated

### DC Electrical Characteristics - Power - Core

	Characteristics	Sym	Typ.	Max.	Units	Notes
1	Core supply current (Vcore)	$I_{CORE}$ (Vdd 3.3V)	46	48	mA	
		$I_{CORE}$ (Vdd 1.8V)	102	109	mA	
2	Current for HP Synthesis Engine	$I_{SYN}$ (Vdd 3.3V)	114	146	mA	
		$I_{SYN}$ (Vdd 1.8V)	0.4	2	mA	
3	Current for General Purpose Synthesis Engine	$I_{SYN}$ (Vdd 3.3V)	8	14	mA	
		$I_{SYN}$ (Vdd 1.8V)	24	26	mA	

**DC Electrical Characteristics - Power - High Performance Outputs**

	Characteristics	Sym.	Typ.	Max.	Units	Notes
1	Power for each hpdiff clock driver	$P_{\text{hpdiff}}(\text{Vdd } 3.3\text{V})$	85	91	mW	Including power to biasing and load resistors $R_L = 50\Omega$
2	Power for each hpdiff clock driver minus power dissipated in the biasing and load resistors.	$P_{\text{hpdiff}}(\text{Vdd } 3.3\text{V})$	36	42	mW	Without power to biasing and load resistors $R_L = 50\Omega$
3	Power for each hpdiff clock driver (reduced power mode)	$P_{\text{hpdifflp}}(\text{Vdd } 3.3\text{V})$	80	86	mW	Including power to biasing and load resistors $R_L = 50\Omega$
4	Power for each hpdiff clock driver minus power dissipated in the load resistor. (reduced power mode)	$P_{\text{hpdifflp}}(\text{Vdd } 3.3\text{V})$	31	37	mW	Without power to biasing and load resistors $R_L = 50\Omega$
5	Power for each output divider of high performance synthesizers (enabled if one of two differential outputs assigned to it is enabled).	$P_{\text{div}}(\text{Vdd } 3.3\text{V})$	17	40	mW	
6	Power for each hpoutclk clock driver	$P_{\text{hpout}}(\text{Vdd } 3.3\text{V})$	17+ 7	40+36	mW	155.52 MHz output 10 pF load fixed power (due to output divider) + variable power (proportional to frequency and load)

**DC Electrical Characteristics\* - Power - Configurable Outputs**

	Characteristics	Sym.	Typ.	Max.	Units	Notes
1	Power for each outclk clock driver in LVDS mode	$P_{\text{Out-LVDS}}$	32	35	mW	Including power to load resistor $R_L = 100\Omega$
2	Power for each LVDS clock driver minus power dissipated in the load resistor	$P_{\text{Out-LVDS}}$	31	34	mW	Without power to load resistor $R_L = 100\Omega$
3	Power for each outclk clock driver in LVPECL mode	$P_{\text{Out-LVPECL}}$	80	81	mW	Including power to biasing and load resistors $R_L = 50\Omega$
4	Power for each LVPECL clock driver minus power dissipated in the biasing and load resistors	$P_{\text{Out-LVPECL}}$	38	39	mW	Without power to biasing and load resistors $R_L = 50\Omega$
5	Power for each outclk clock driver in HCSL mode	$P_{\text{Out-HCSL}}$	62	64	mW	Including power to load resistors $R_L = 33\Omega + 50\Omega$
6	Power for each HCSL clock driver minus power dissipated in the load resistors	$P_{\text{Out-HCSL}}$	46	48	mW	Including power to load resistors $R_L = 33\Omega + 50\Omega$
7	Power for each outclk clock driver in 1.5 V CMOS mode	$P_{\text{Out-CMOS1.5}}$	5.9	6.2	mW	$C_L = 10\text{pF @}155.52\text{MHz}$ (proportional to frequency and load)
8	Power for each outclk clock driver in 1.8 V CMOS mode	$P_{\text{Out-CMOS1.8}}$	9	10	mW	$C_L = 10\text{pF @}155.52\text{MHz}$ (proportional to frequency and load)
9	Power for each outclk clock driver in 2.5 V CMOS mode	$P_{\text{Out-CMOS2.5}}$	23	24	mW	$C_L = 10\text{pF @}155.52\text{MHz}$ (proportional to frequency and load)
10	Power for each outclk clock driver in 3.3 V CMOS mode	$P_{\text{Out-CMOS3.3}}$	42	44	mW	$C_L = 10\text{pF @}155.52\text{MHz}$ (proportional to frequency and load)

\* Supply voltage and operating temperature are as per Recommended Operating Conditions.

\* Voltages are with respect to ground (GND) unless otherwise state.

**DC Electrical Characteristics - Inputs**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	CMOS high-level input voltage	$V_{\text{CIH}}$	$0.7 \cdot V_{\text{DD}}$ -IO			V	
2	CMOS low-level input voltage	$V_{\text{CIL}}$			$0.3 \cdot V_{\text{DD}}$ -IO	V	
3	CMOS Input leakage current	$I_{\text{IL}}$	-10		10	$\mu\text{A}$	$V_I = V_{\text{DD}}$ or 0 V
4	Differential input common mode voltage	$V_{\text{CM}}$	1.1		2.0	V	
5	Differential input voltage difference	$V_{\text{ID}}$	0.25		1.0	V	

**AC/DC Electrical Characteristics - OSCi Input**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	CMOS high-level input voltage	$V_{CIH}$	2.0			V	
2	CMOS low-level input voltage	$V_{CIL}$			0.8	V	
3	Input leakage current	$I_{IL}$	-10		10	$\mu A$	$V_I = V_{DD}$ or 0 V
4	Duty Cycle		40		60	%	

**DC Electrical Characteristics - High Performance Outputs**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	HPCMOS High-level output voltage	$V_{OH}$	$0.8AV_{DD}$			V	$I_{OH} = 2mA$ $C_L = 5pF$
2	HPCMOS Low-level output voltage	$V_{OL}$			$0.2AV_{DD}$	V	$I_{OL} = 2mA$ $C_L = 5pF$
3	LVPECL: High-level output voltage	$V_{OH\_LV}$ PECL	$AV_{DD}$ - 1.12	$AV_{DD}$ - 1.00	$AV_{DD}$ - 0.88	V	$R_L = 50\Omega$ to $AV_{DD} - 2V$ , $C_L = 1pF$
4	LVPECL: Low-level output voltage	$V_{OL\_LVP}$ ECL	$AV_{DD}$ - 1.81	$AV_{DD}$ - 1.71	$AV_{DD}$ - 1.55	V	$R_L = 50\Omega$ to $AV_{DD} - 2V$ , $C_L = 1pF$
5	LVPECL: Differential output voltage*	$V_{OD\_LV}$ PECL	0.53	0.67	0.80	V	$R_L = 50\Omega$ to $AV_{DD} - 2V$ , $C_L = 1pF$

\* Output swing is guaranteed for frequency up to 720MHz, it may decrease by 50mv if the frequency is greater than 720MHz

**DC Electrical Characteristics - Configurable Outputs**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	3.3 V CMOS High-level output voltage	$V_{OH}$	$0.8 \cdot B1V_{DD-IO}$ $0.8 \cdot B2V_{DD-IO}$			V	$I_{OH} = 2mA$ $C_L = 5pF$
2	3.3 V CMOS Low-level output voltage	$V_{OL}$			$0.2 \cdot B1V_{DD-IO}$ $0.2 \cdot B2V_{DD-IO}$	V	$I_{OL} = 2mA$ $C_L = 5pF$
3	2.5 V CMOS High-level output voltage	$V_{OH}$	$0.8 \cdot B1V_{DD-IO}$ $0.8 \cdot B2V_{DD-IO}$			V	$I_{OH} = 2mA$ $C_L = 5pF$
4	2.5 V CMOS Low-level output voltage	$V_{OL}$			$0.2 \cdot B1V_{DD-IO}$ $0.2 \cdot B2V_{DD-IO}$	V	$I_{OL} = 2mA$ $C_L = 5pF$

**DC Electrical Characteristics - Configurable Outputs**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
5	1.8 V CMOS High-level output voltage	$V_{OH}$	0.8·B1V DD-IO 0.8·B2V DD-IO			V	$I_{OH} = 2\text{mA}$ $C_L = 5\text{pF}$
6	1.8 V CMOS Low-level output voltage	$V_{OL}$			0.2·B1V DD-IO 0.2·B2V DD-IO	V	$I_{OL} = 2\text{mA}$ $C_L = 5\text{pF}$
7	1.5 V CMOS High-level output voltage	$V_{OH}$	0.8·B1V DD-IO 0.8·B2V DD-IO			V	$I_{OH} = 2\text{mA}$ $C_L = 5\text{pF}$
8	1.5 V CMOS Low-level output voltage	$V_{OL}$			0.2·B1V DD-IO 0.2·B2V DD-IO	V	$I_{OL} = 2\text{mA}$ $C_L = 5\text{pF}$
9	LVPECL: High-level output voltage	$V_{OH\_LV}$ PECL	$AV_{DD}$ - 1.12	$AV_{DD}$ - 1.00	$AV_{DD}$ - 0.88	V	$R_L = 50\Omega$ to $AV_{DD} - 2\text{V}$ , $C_L = 1\text{pF}$
10	LVPECL: Low-level output voltage	$V_{OL\_LVP}$ ECL	$AV_{DD}$ - 1.81	$AV_{DD}$ - 1.71	$AV_{DD}$ - 1.55	V	$R_L = 50\Omega$ to $AV_{DD} - 2\text{V}$ , $C_L = 1\text{pF}$
11	LVPECL: Differential output voltage	$V_{OD\_LV}$ PECL	0.48	0.64	0.80	V	$R_L = 50\Omega$ to $AV_{DD} - 2\text{V}$ , $C_L = 1\text{pF}$
12	LVDS: High-level output voltage	$V_{OH\_LV}$ DS	1.18	1.30	1.47	V	$R_L = 100\Omega$ , $C_L = 1\text{pF}$
13	LVDS: Low-level output voltage	$V_{OL\_LVD}$ S	0.91	0.98	1.10	V	$R_L = 100\Omega$ , $C_L = 1\text{pF}$
14	LVDS: Differential output voltage	$V_{OD\_LV}$ DS	0.27	0.32	0.37	V	$R_L = 100\Omega$ , $C_L = 1\text{pF}$
15	LVDS: output offset voltage	$V_{OFF\_LV}$ DS		30		mV	$R_L = 100\Omega$ , $C_L = 1\text{pF}$
16	HCSL: High-level output voltage	$V_{OH\_HC}$ SL	0.6	0.7	0.9	V	$R_L = 50\Omega$ each to ground $C_L = 5\text{pF}$
17	HCSL: Low-level output voltage	$V_{OL\_HC}$ SL	0.00	0.01	0.03	V	$R_L = 50\Omega$ each to ground $C_L = 5\text{pF}$

**AC Electrical Characteristics\* - Output Timing Parameters Measurement Voltage Levels (see Figure 29)**

	Characteristics	Sym.	CMOS	LVPECL	LVDS	Units
1	Threshold Voltage	$V_{T-CMOS}$ $V_{T-LVPECL}$ $V_{T-CML}$	$0.5V_{DD}$	$V_{DD}-1.35$	1.14	V
2	Rise and Fall Threshold Voltage High	$V_{HM}$	$0.8V_{DD}$	$0.8V_{OD\_LVPECL}$	$0.8V_{OD\_LVDS}$	V
3	Rise and Fall Threshold Voltage Low	$V_{LM}$	$0.2V_{DD}$	$0.2V_{OD\_LVPECL}$	$0.2V_{OD\_LVDS}$	V

\* Supply voltage and operating temperature are as per Recommended Operating Conditions.

\* Voltages are with respect to ground (GND) unless otherwise stated

**Figure 29 - Timing Parameter Measurement Voltage Levels**

**AC Electrical Characteristics\* - Inputs (see Figure 30).**

	Characteristics	Symbol	Min.	Typ.	Max.	Units
1	Input reference Frequency (CMOS Inputs)	$1/t_{REFP}$			177.5	MHz
2	Input reference Frequency (LVPECL Inputs)	$1/t_{REFP}$			750	MHz
3	Input reference pulse width high or low	$t_{REFW}$	0.55			ns

\* Supply voltage and operating temperature are as per Recommended Operating Conditions

**AC Electrical Characteristics\* - Input To Output Timing (see Figure 30)**

	Characteristics	Symbol	Min.	Typ.	Max.	Units
1	Input reference to hpoutclk0 output clock (with same frequency) delay	$t_{HP\_REFD}$	-2	0	+2	ns
2	Input reference to outclk0 (with same frequency) delay	$t_{REFD}$		0		ns

\* Supply voltage and operating temperature are as per Recommended Operating Conditions.

Figure 30 - Input To Output Timing for hputclk0

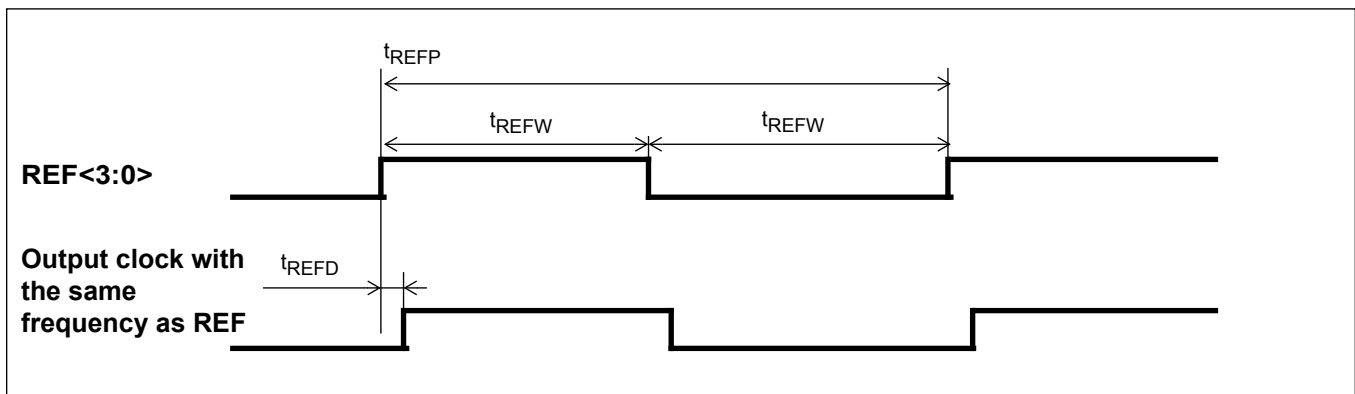

Figure 31 - Input To Output Timing To outclk0

**AC Electrical Characteristics\* - Outputs (see Figure 32).**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	Clock skew between high performance outputs	$t_{OUT2OUTD}$	-1	0	+1	ns	
2	Clock skew between configurable outputs	$t_{OUT2OUTD}$		0		ns	
3	Output clock Duty Cycle	$t_{PWH}, t_{PWL}$	45%	50%	55%	Duty Cycle	
4	hpdiff (LVPECL) Output clock rise or fall time	$t_r / t_f$	265	370	515	ps	
5	hpoutclk (LVCMOS) clock rise and fall time	$t_r / t_f$	620	950	1490	ps	10pF load
6	Output Clock Frequency (hpdiff)	$F_{hpdiff}$			750	MHz	
7	Output Clock Frequency (hpoutclk)	$F_{hpout}$			177.5	MHz	
8	Output Clock Frequency (single-ended configurable outclk outputs)	$F_{out}$			160	MHz	
9	Output Clock Frequency (differential configurable outclk outputs)	$F_{out\_diff}$			350	MHz	

\* Supply voltage and operating temperature are as per Recommended Operating Conditions

**Figure 32 - Output Timing Referenced To hpclkout0/clkout0**

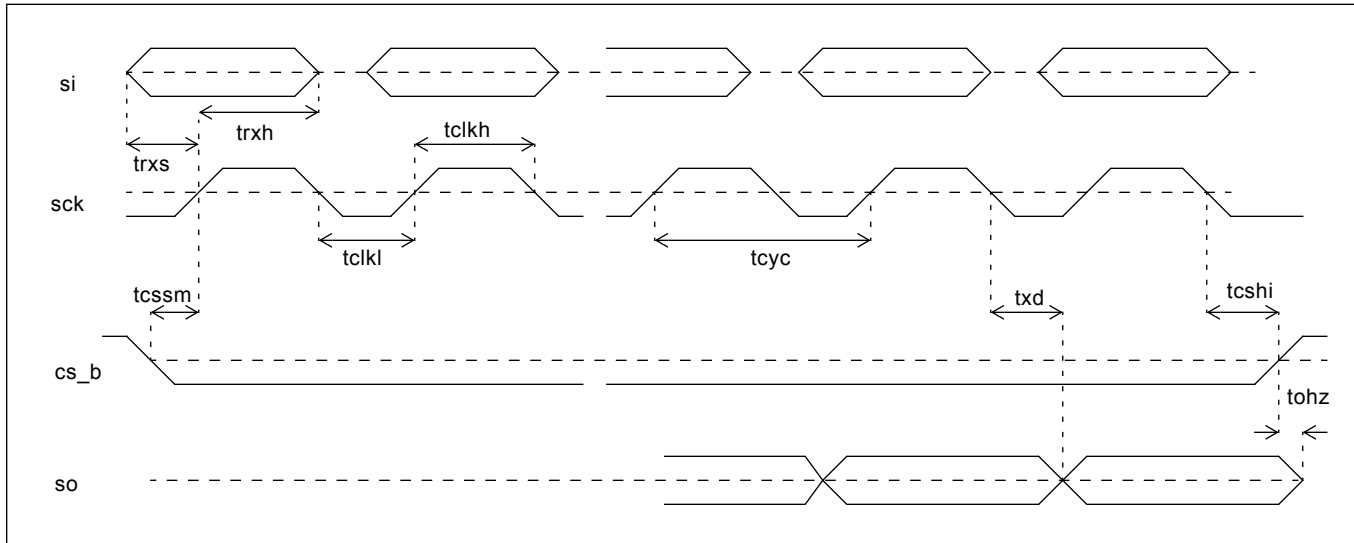

Functional waveforms and timing characteristics for the LSB first mode are shown in Figure 33, and Figure 34 describe the MSB first mode. Table 8 shows the timing specifications.

Specification	Name	Min.	Max.	Units
sck period	tcyc	124		ns
sck pulse width low	tclk <sub>l</sub>	62		ns
sck pulse width high	tclk <sub>h</sub>	62		ns
si setup (write) from sck rising	trxs	10		ns
si hold (write) from sck rising	trxh	10		ns
so delay (read) from sck falling	txd		25	ns
cs_b setup from sck falling (LSB first)	tcssi	20		ns
cs_b setup from sck rising (MSB first)	tcssm	20		ns
cs_b hold from sck falling (MSB first)	tcshm	10		ns
cs_b hold from sck rising (LSB first)	tcshi	10		ns
cs_b to output high impedance	tohz		60	ns

**Table 8 - Serial Peripheral Interface Timing**

**Figure 33 - Serial Peripheral Interface Timing - LSB First Mode**

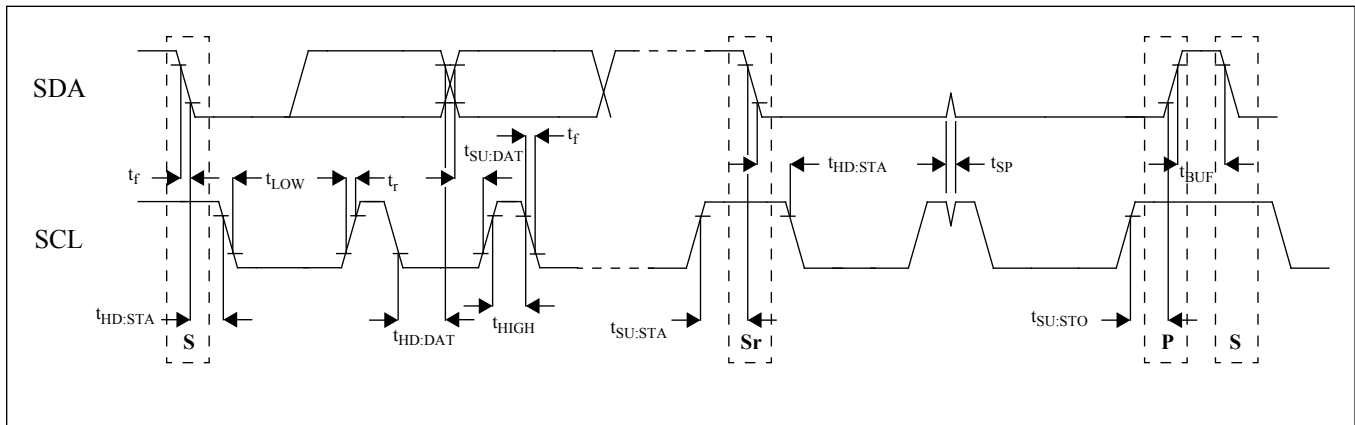

**Figure 34 - Serial Peripheral Interface Timing - MSB First Mode**

The timing specification for the I<sup>2</sup>C interface is shown in Figure 35 and Table 9.

Specification	Name	Min.	Typ.	Max.	Units	Note
SCL clock frequency	$f_{SCL}$	0		400	kHz	
Hold time START condition	$t_{HD:STA}$	0.6			us	
Low period SCL	$t_{LOW}$	1.3			us	
Hi period SCL	$t_{HIGH}$	0.6			us	
Setup time START condition	$t_{SU:STA}$	0.6			us	
Data hold time	$t_{HD:DAT}$	0		0.9	us	
Data setup time	$t_{SU:DAT}$	100			ns	
Rise time	$t_r$				ns	Determined by choice of pull-up resistor
Fall time	$t_f$	20 + $0.1C_b$		250	ns	
Setup time STOP condition	$t_{SU:STO}$	0.6			us	
Bus free time between STOP/START	$t_{BUF}$	1.3			us	
Pulse width of spikes which must be suppressed by the input filter	$t_{SP}$	0		50	ns	
Max capacitance for each I/O pin				10	pF

**Figure 35 - I<sup>2</sup>C Serial Microport Timing**

## 10.0 Performance Characterization

### 10.1 Output Clocks Jitter Generation

Output Frequency	Jitter Measurement Filter	Max.	Units	Notes
622.08 MHz	50 kHz - 80 MHz	0.64	ps <sub>rms</sub>	
	12 kHz - 20 MHz	0.73	ps <sub>rms</sub>	

**Table 10 - Jitter Generation Specifications - HPDIFF Outputs**

Output Frequency	Jitter Measurement Filter	Max.	Units	Notes
25 MHz	12 kHz - 5 MHz	0.99	ps <sub>rms</sub>	
77.76 MHz	12 kHz - 20 MHz	0.97	ps <sub>rms</sub>	
125 MHz	12 kHz - 20 MHz	0.86	ps <sub>rms</sub>	
156.25 MHz	12 kHz - 20 MHz	0.94	ps <sub>rms</sub>	

**Table 11 - Jitter Generation Specifications - HPOUT Outputs**

Output Frequency	Jitter Measurement Filter	Max.	Units	Notes
25 MHz	12 kHz - 5 MHz	2.9	ps <sub>rms</sub>	
77.76 MHz	12 kHz - 20 MHz	1.8	ps <sub>rms</sub>	
125 MHz	12 kHz - 20 MHz	1.56	ps <sub>rms</sub>	
156.25 MHz	12 kHz - 20 MHz	1.61	ps <sub>rms</sub>	

**Table 12 - Jitter Generation Specifications - Configurable Outputs driven from High Performance Synthesizers - Differential Mode**

Output Frequency	Jitter Measurement Filter	Max.	Units	Notes
25 MHz	12 kHz - 5 MHz	14.5	ps <sub>rms</sub>	
77.76 MHz	12 kHz - 20 MHz	15.3	ps <sub>rms</sub>	
125 MHz	12 kHz - 20 MHz	16.7	ps <sub>rms</sub>	
156.25 MHz	12 kHz - 20 MHz	16.5	ps <sub>rms</sub>	

**Table 13 - Jitter Generation Specifications - Configurable Outputs driven from General Purpose Synthesizers - Differential Mode**

## 10.2 DPLL Performance Characteristics

	Characteristics	Min.	Typ.	Max.	Units	Notes
1	Pull-in/Hold-in Range	+/-52		+/-3900	ppm	user selectable
2	Lock Time *			1	sec	
3	Reference Switching MTIE			5	nsec	
4	Entry into Holdover MTIE			5	nsec	
5	Exit from Holdover MTIE			5	nsec	
6	Holdover Accuracy			50	ppb	
7	Phase gain in the passband			0.1	dB	

\* Lock time of 1 sec is achieved when pulling a 9.2 ppm reference for any selected bandwidth and when phase slope limit is larger than 7.5 usec.

**Table 14 - DPLL Characteristics**

## 11.0 Thermal Characteristics

Parameter	Symbol	Test Condition	Value	Unit
Junction to Ambient Thermal Resistance	$\theta_{ja}$	Still Air 1 m/s 2 m/s	29.7 26.5 25.3	°C/W
Junction to Case Thermal Resistance	$\theta_{jc}$		7.7	°C/W
Maximum Junction Temperature *	$T_{jmax}$		125	°C
Maximum Ambient Temperature	$T_A$		85	°C

\* Proper thermal management must be practiced to ensure that  $T_{jmax}$  is not exceeded.

**Table 15 - Thermal Care**

## 13.0 Package Markings

### 13.1 100-pin BGA. Package Top Mark Format

Figure 36 - Non-customized Device Top Mark

Figure 37 - Custom Factory Programmed Device Top Mark

Line	Characters	Description
1	ZL30157	Part Number
2	F	Fab Code
2	R	Product Revision Code
2	e1	Denotes Pb-Free Package
3	YY	Last Two Digits of the Year of Encapsulation
3	WW	Work Week of Assembly
3	A	Assembly Location Code
3	ZZ	Assembly Lot Sequence
4	CCID	Custom Programming Identification Code
4	WP	Work Week of Programming

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for communications, defense & security, aerospace and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; security technologies and scalable anti-tamper products; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif., and has approximately 3,400 employees globally. Learn more at [www.microsemi.com](http://www.microsemi.com).

Microsemi makes no warranty, representation, or guarantee regarding the information contained herein or the suitability of its products and services for any particular purpose, nor does Microsemi assume any liability whatsoever arising out of the application or use of any product or circuit. The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same. The information provided by Microsemi hereunder is provided "as is, where is" and with all faults, and the entire risk associated with such information is entirely with the Buyer. Microsemi does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other IP rights, whether with regard to such information itself or anything described by such information. Information provided in this document is proprietary to Microsemi, and Microsemi reserves the right to make any changes to the information in this document or to any products and services at any time without notice.
