

CAT28C256

PIN CONFIGURATION

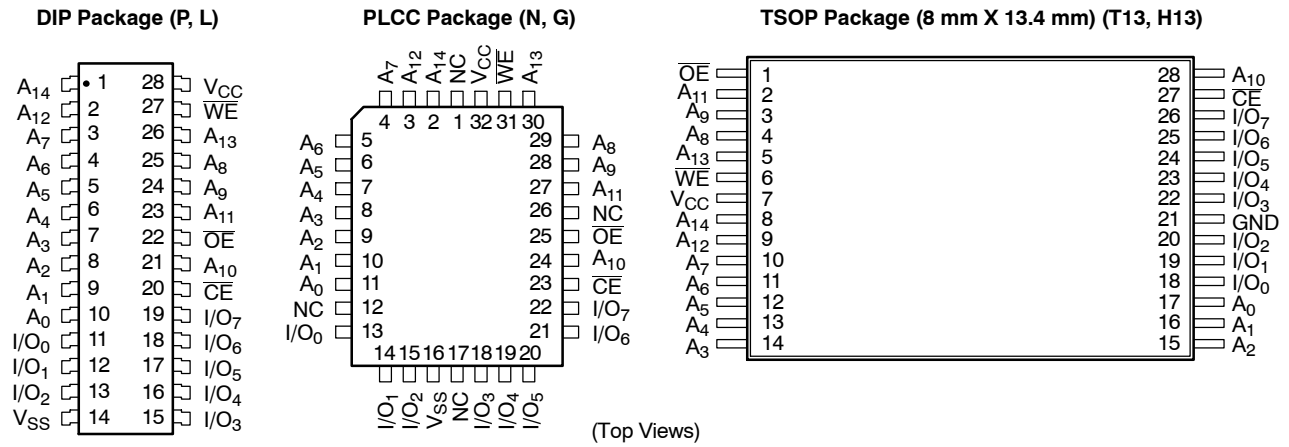

Figure 1. Block Diagram

Table 1. ABSOLUTE MAXIMUM RATINGS

Parameters	Ratings	Units
Temperature Under Bias	–55 to +125	°C
Storage Temperature	–65 to +150	°C
Voltage on Any Pin with Respect to Ground (Note 1)	–2.0 V to +V _{CC} + 2.0 V	V
V _{CC} with Respect to Ground	–2.0 to +7.0	V
Package Power Dissipation Capability (T _A = 25°C)	1.0	W
Lead Soldering Temperature (10 secs)	300	°C
Output Short Circuit Current (Note 2)	100	mA

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. The minimum DC input voltage is –0.5 V. During transitions, inputs may undershoot to –2.0 V for periods of less than 20 ns. Maximum DC voltage on output pins is V_{CC} + 0.5 V, which may overshoot to V_{CC} + 2.0 V for periods of less than 20 ns.
2. Output shorted for no more than one second. No more than one output shorted at a time.

Table 2. RELIABILITY CHARACTERISTICS (Note 3)

Symbol	Parameter	Test Method	Min	Max	Units
N _{END}	Endurance	MIL–STD–883, Test Method 1033	100,000		Cycles/Byte
T _{DR}	Data Retention	MIL–STD–883, Test Method 1008	100		Years
V _{ZAP}	ESD Susceptibility	MIL–STD–883, Test Method 3015	2,000		V
I _{LTH} (Note 4)	Latch-Up	JEDEC Standard 17	100		mA

3. These parameters are tested initially and after a design or process change that affects the parameters.
4. Latch-up protection is provided for stresses up to 100 mA on address and data pins from –1 V to V_{CC} + 1 V.

Table 3. D.C. OPERATING CHARACTERISTICS (V_{CC} = 5 V ±10%, unless otherwise specified.)

Symbol	Parameter	Test Conditions	Limits			Units
			Min	Typ	Max	
I _{CC}	V _{CC} Current (Operating, TTL)	$\overline{CE} = \overline{OE} = V_{IL}$, f = 8 MHz, All I/O's Open			30	mA
I _{CCC} (Note 5)	V _{CC} Current (Operating, CMOS)	$\overline{CE} = \overline{OE} = V_{ILC}$, f = 8 MHz, All I/O's Open			25	mA
I _{SB}	V _{CC} Current (Standby, TTL)	$\overline{CE} = V_{IH}$, All I/O's Open			1	mA
I _{SBC} (Note 6)	V _{CC} Current (Standby, CMOS)	$\overline{CE} = V_{IHC}$, All I/O's Open			150	μA
I _{LI}	Input Leakage Current	V _{IN} = GND to V _{CC}	–10		10	μA
I _{LO}	Output Leakage Current	V _{OUT} = GND to V _{CC} , $\overline{CE} = V_{IH}$	–10		10	μA
V _{IH} (Note 6)	High Level Input Voltage		2		V _{CC} + 0.3	V
V _{IL} (Note 5)	Low Level Input Voltage		–0.3		0.8	V
V _{OH}	High Level Output Voltage	I _{OH} = –400 μA	2.4			V
V _{OL}	Low Level Output Voltage	I _{OL} = 2.1 mA			0.4	V
V _{WI}	Write Inhibit Voltage		3.5			V

5. V_{ILC} = –0.3 V to +0.3 V.
6. V_{IHC} = V_{CC} –0.3 V to V_{CC} + 0.3 V.

CAT28C256

Table 4. MODE SELECTION

Mode	CE	WE	OE	I/O	Power
Read	L	H	L	D _{OUT}	ACTIVE
Byte Write (\overline{WE} Controlled)	L		H	D _{IN}	ACTIVE
Byte Write (\overline{CE} Controlled)		L	H	D _{IN}	ACTIVE
Standby and Write Inhibit	H	X	X	High-Z	STANDBY
Read and Write Inhibit	X	H	H	High-Z	ACTIVE

Table 5. CAPACITANCE ($T_A = 25^\circ\text{C}$, $f = 1.0\text{ MHz}$, $V_{CC} = 5\text{ V}$)

Symbol	Test	Max	Conditions	Units
$C_{I/O}$ (Note 7)	Input/Output Capacitance	10	$V_{I/O} = 0\text{ V}$	pF
C_{IN} (Note 7)	Input Capacitance	6	$V_{IN} = 0\text{ V}$	pF

7. This parameter is tested initially and after a design or process change that affects the parameter.

Table 6. A.C. CHARACTERISTICS, READ CYCLE ($V_{CC} = 5\text{ V} \pm 10\%$, unless otherwise specified.)

Symbol	Parameter	28C256-12		28C256-15		Units
		Min	Max	Min	Max	
t_{RC}	Read Cycle Time	120		150		ns
t_{CE}	\overline{CE} Access Time		120		150	ns
t_{AA}	Address Access Time		120		150	ns
t_{OE}	\overline{OE} Access Time		50		70	ns
t_{LZ} (Note 8)	\overline{CE} Low to Active Output	0		0		ns
t_{OLZ} (Note 8)	\overline{OE} Low to Active Output	0		0		ns
t_{HZ} (Notes 8, 9)	\overline{CE} High to High-Z Output		50		50	ns
t_{OHZ} (Notes 8, 9)	\overline{OE} High to High-Z Output		50		50	ns
t_{OH} (Note 8)	Output Hold from Address Change	0		0		ns

8. This parameter is tested initially and after a design or process change that affects the parameter.

9. Output floating (High-Z) is defined as the state when the external data line is no longer driven by the output buffer.

CAT28C256

Table 7. A.C. CHARACTERISTICS, WRITE CYCLE ($V_{CC} = 5\text{ V} \pm 10\%$, unless otherwise specified.)

Symbol	Parameter	28C256-12		28C256-15		Units
		Min	Max	Min	Max	
t_{WC}	Write Cycle Time		5		5	ms
t_{AS}	Address Setup Time	0		0		ns
t_{AH}	Address Hold Time	50		50		ns
t_{CS}	\overline{CE} Setup Time	0		0		ns
t_{CH}	\overline{CE} Hold Time	0		0		ns
t_{CW} (Note 10)	\overline{CE} Pulse Time	100		100		ns
t_{OES}	\overline{OE} Setup Time	0		0		ns
t_{OEH}	\overline{OE} Hold Time	0		0		ns
t_{WP} (Note 10)	\overline{WE} Pulse Width	100		100		ns
t_{DS}	Data Setup Time	50		50		ns
t_{DH}	Data Hold Time	10		10		ns
t_{INIT} (Note 11)	Write Inhibit Period After Power-up	5	10	5	10	ms
t_{BLC} (Notes 11, 12)	Byte Load Cycle Time	0.1	100	0.1	100	μs

10. A write pulse of less than 20 ns duration will not initiate a write cycle.

11. This parameter is tested initially and after a design or process change that affects the parameter.

12. A timer of duration t_{BLC} max. begins with every LOW to HIGH transition of \overline{WE} . If allowed to time out, a page or byte write will begin; however a transition from HIGH to LOW within t_{BLC} max. stops the timer.

Figure 2. A.C. Testing Input/Output Waveform (Note 13)

13. Input rise and fall times (10% and 90%) < 10 ns.

C_L INCLUDES JIG CAPACITANCE

Figure 3. A.C. Testing Load Circuit (example)

DEVICE OPERATION

Read

Data stored in the CAT28C256 is transferred to the data bus when \overline{WE} is held high, and both \overline{OE} and \overline{CE} are held low. The data bus is set to a high impedance state when either \overline{CE} or \overline{OE} goes high. This 2-line control architecture can be used to eliminate bus contention in a system environment.

Byte Write

A write cycle is executed when both \overline{CE} and \overline{WE} are low, and \overline{OE} is high. Write cycles can be initiated using either \overline{WE} or \overline{CE} , with the address input being latched on the falling edge of \overline{WE} or \overline{CE} , whichever occurs last. Data, conversely, is latched on the rising edge of \overline{WE} or \overline{CE} , whichever occurs first. Once initiated, a byte write cycle automatically erases the addressed byte and the new data is written within 5 ms.

Figure 4. Read Cycle

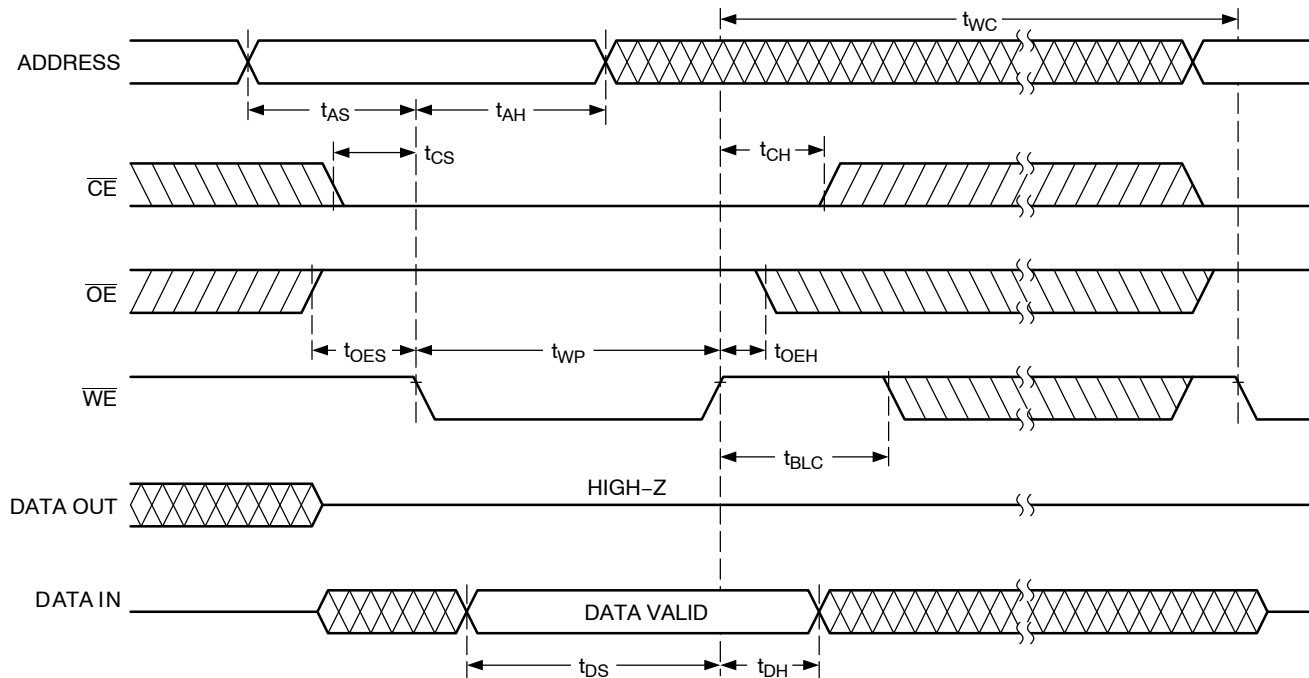

Figure 5. Byte Write Cycle [\overline{WE} Controlled]

Page Write

The page write mode of the CAT28C256 (essentially an extended BYTE WRITE mode) allows from 1 to 64 bytes of data to be programmed within a single EEPROM write cycle. This effectively reduces the byte-write time by a factor of 64.

Following an initial WRITE operation (\overline{WE} pulsed low, for t_{WP} , and then high) the page write mode can begin by issuing sequential \overline{WE} pulses, which load the address and data bytes into a 64 byte temporary buffer. The page address where data is to be written, specified by bits A_6 to A_{14} , is latched on the last falling edge of \overline{WE} . Each byte within the page is defined by address bits A_0 to A_5 (which can be loaded

in any order) during the first and subsequent write cycles. Each successive byte load cycle must begin within t_{BLCMAX} of the rising edge of the preceding \overline{WE} pulse. There is no page write window limitation as long as \overline{WE} is pulsed low within t_{BLCMAX} .

Upon completion of the page write sequence, \overline{WE} must stay high a minimum of t_{BLCMAX} for the internal automatic program cycle to commence. This programming cycle consists of an erase cycle, which erases any data that existed in each addressed cell, and a write cycle, which writes new data back into the cell. A page write will only write data to the locations that were addressed and will not rewrite the entire page.

Figure 6. Byte Write Cycle [\overline{CE} Controlled]

Figure 7. Page Mode Write Cycle

CAT28C256

DATA Polling

DATA polling is provided to indicate the completion of write cycle. Once a byte write or page write cycle is initiated, attempting to read the last byte written will output the complement of that data on I/O₇ (I/O₀–I/O₆ are indeterminate) until the programming cycle is complete. Upon completion of the self-timed write cycle, all I/O's will output true data during a read cycle.

Toggle Bit

In addition to the DATA Polling feature of the CAT28C256, the device offers an additional method for determining the completion of a write cycle. While a write cycle is in progress, reading data from the device will result in I/O₆ toggling between one and zero. However, once the write is complete, I/O₆ stops toggling and valid data can be read from the device.

Figure 8. DATA Polling

Figure 9. Toggle Bit

14. Beginning and ending state of I/O₆ is indeterminate.

Hardware Data Protection

The following is a list of hardware data protection features that are incorporated into the CAT28C256.

1. V_{CC} sense provides for write protection when V_{CC} falls below 3.5 V min.
2. A power on delay mechanism, t_{INIT} (see AC characteristics), provides a 5 to 10 ms delay before a write sequence, after V_{CC} has reached 3.5 V min.
3. Write inhibit is activated by holding any one of \overline{OE} low, \overline{CE} high or \overline{WE} high.

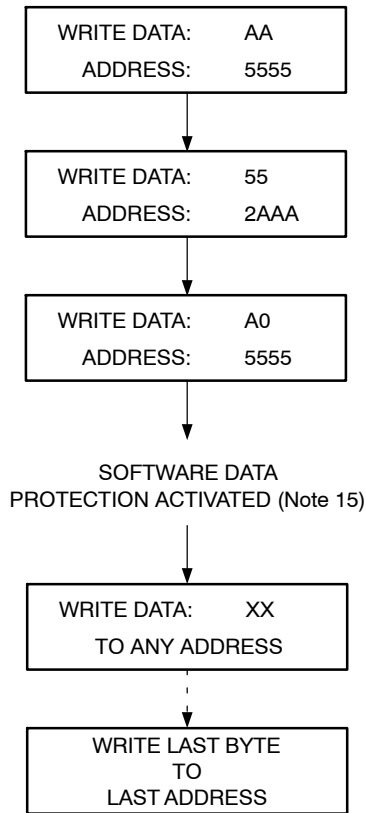

Figure 10. Write Sequence for Activating Software Data Protection

4. Noise pulses of less than 20 ns on the \overline{WE} or \overline{CE} inputs will not result in a write cycle.

Software Data Protection

The CAT28C256 features a software controlled data protection scheme which, once enabled, requires a data algorithm to be issued to the device before a write can be performed. The device is shipped from ON Semiconductor with the software protection NOT ENABLED (the CAT28C256 is in the standard operating mode).

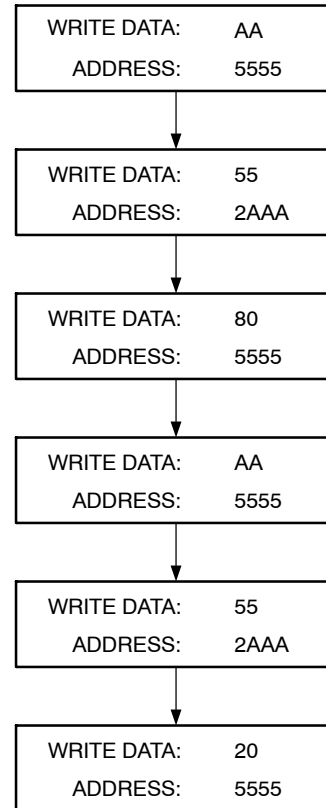

Figure 11. Write Sequence for Deactivating Software Data Protection

15. Write protection is activated at this point whether or not any more writes are completed. Writing to addresses must occur within t_{BLC} Max., after SDP activation.

To activate the software data protection, the device must be sent three write commands to specific addresses with specific data (Figure 10). This sequence of commands (along with subsequent writes) must adhere to the page write timing specifications (Figure 12). Once this is done, all subsequent byte or page writes to the device must be preceded by this same set of write commands. The data protection mechanism is activated until a deactivate sequence is issued regardless of power on/off transitions. This gives the user added inadvertent write protection on power-up in addition to the hardware protection provided.

To allow the user the ability to program the device with an EEPROM programmer (or for testing purposes) there is a software command sequence for deactivating the data protection. The six step algorithm (Figure 11) will reset the internal protection circuitry, and the device will return to standard operating mode (Figure 13 provides reset timing). After the sixth byte of this reset sequence has been issued, standard byte or page writing can commence.
