Pin Description

Pin No.		Pin Name	Pin Function
TSOT-23-5	TSOT-23-6		
1	1	LX	Switch Pin. Connect this Pin to inductor and catch diode. Minimize the track area to reduce EMI.
2	2	GND	Ground Pin.
3	3	FB	Feedback Reference Voltage Pin. Series connect a resistor between WLED and ground as a current sense. Sense the current feedback voltage to set the current rating.
4	4	EN	Chip Enable (Active High). Voltage sensing input to trigger the function of over voltage protection. Note that this pin is high impedance. There should be a pull low 100k Ω resistor connected to GND when the control signal is floating.
--	5	OVP	Over Voltage Protection Pin. Voltage sensing input to trigger the function of over voltage protection. Leave it unconnected to disable this function.
5	6	VDD	Supply Input Voltage Pin. Bypass 1uF capacitor to GND to reduce the input noise.

Function Block Diagram

Absolute Maximum Ratings (Note 1)

- Supply Input Voltage ----- -0.3V to 7V
- LX Input Voltage ----- -0.3V to 22V
- OVP Voltage ----- -0.3V to 22V
- The Other Pins ----- -0.3V to 6V
- Power Dissipation, P_D @ $T_A = 25^\circ\text{C}$
 - TSOT-23-5 ----- 0.455W
 - TSOT-23-6 ----- 0.455W
- Package Thermal Resistance (Note 2)
 - TSOT-23-5, θ_{JA} ----- 220°C/W
 - TSOT-23-6, θ_{JA} ----- 220°C/W
- Lead Temperature (Soldering, 10 sec.) ----- 260°C
- Junction Temperature ----- 150°C
- Storage Temperature Range ----- -65°C to 150°C
- ESD Susceptibility (Note 3)
 - HBM (Human Body Mode) ----- 2kV
 - MM (Machine Mode) ----- 200V

Recommended Operating Conditions (Note 4)

- Junction Temperature Range ----- -40°C to 125°C
- Ambient Temperature Range ----- -40°C to 85°C

Electrical Characteristics

($V_{IN} = 3.7\text{V}$, $T_A = 25^\circ\text{C}$ unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
System Supply Input						
Operation Voltage Range	V_{DD}		2.7	--	5.5	V
Under Voltage Lock Out	V_{DD}		1.8	2.2	2.5	V
Quiescent Current	I_{DD}	FB = 1.5V, No switch	50	300	1000	μA
Supply Current	I_{DD}	FB = 0V, Switch	0.1	2	3	mA
Shut Down Current	I_{DD}	$V_{EN} < 0.4\text{V}$	--	--	1	μA
Line Regulation		$V_{IN} = 3.0$ to 4.3V	--	3	--	%
Oscillator						
Operation Frequency	f_{OSC}		0.9	1.2	1.5	MHz
Maximum Duty Cycle			85	--	--	%
Reference Voltage						
Feedback Voltage (Note 5)	RT9284A		1.173	1.235	1.296	V
	RT9284B		0.237	0.25	0.263	

To be continued

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
MOSFET						
On Resistance of MOSFET	$R_{DS(ON)}$		--	0.75	--	Ω
Protection						
OVP Threshold	V_{OVP}	for 2,3,4 WLEDs application	14	15	16	V
		for 5 WLEDs application	19	20	21	V
OVP Sink Current			--	5	--	μA
OCP			--	750	--	mA
Shut Down Voltage	V_{EN}		--	--	0.4	V
Enable Voltage	V_{EN}		1.5	--	--	V

Note 1. Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

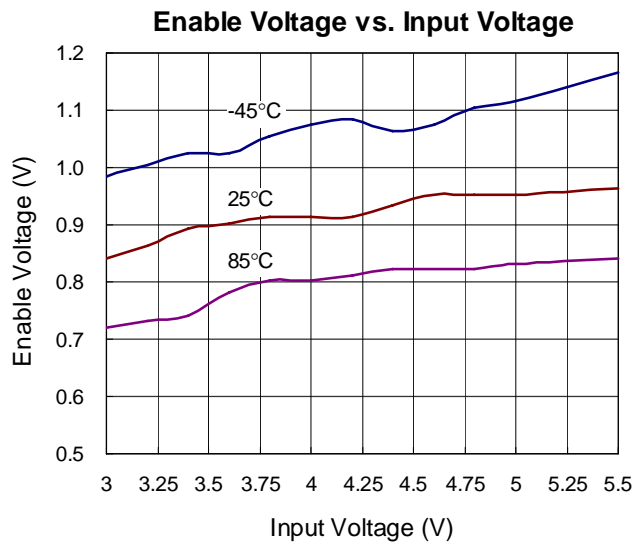

Note 2. θ_{JA} is measured in the natural convection at $T_A = 25^\circ C$ on a low effective thermal conductivity test board of JEDEC 51-3 thermal measurement standard.

Note 3. Devices are ESD sensitive. Handling precaution is recommended.

Note 4. The device is not guaranteed to function outside its operating conditions.

Note 5. Floating the OVP pin to disable OVP function.

Application Information

Power Sequence

The RT9284A/B must take notice of the power sequence. The power sequence of RT9284A/B has to VDD early than EN or else the RT9284A/B maybe fall into the unknown state to result in RT9284A/B turn off.

Figure 5

LED Current Control

The RT9284A/B regulates the LED current by setting the current sense resistor (R1) connecting to feedback and ground. As shown in Table 1, the RT9284A feedback voltage (V_{FB}) is 1.235V and the RT9284B feedback voltage (V_{FB}) is 0.25V. The LED current (I_{LED}) can be set by a resistor R1. In order to have an accurate LED current, a precision resistor is preferred (1% is recommended).

Table 1

Version	Feedback Reference Voltage V _{FB} (V)	LED Current Setting I _{LED} (A)
RT9284A	1.235	I _{LED} = 1.235/R1
RT9284B	0.25	I _{LED} = 0.25/R1

Dimming Control

a. Using a PWM Signal to EN Pin

For controlling the LED brightness, the RT9284A/B can perform the dimming control by applying a PWM signal to EN pin. The internal soft start and the wide range dimming frequency can eliminate inrush current and audio noise when dimming. The average LED current is proportional to the PWM signal duty cycle. The magnitude of the PWM signal should be higher than the maximum enable voltage of EN pin, in order to let the dimming control perform correctly for preventing the flicker issue, the requested PWM frequency is ≥1kHz or ≤200Hz.

b. Using a DC Voltage

Using a variable DC voltage to adjust the brightness is a popular method in some applications. The dimming control using a DC voltage circuit is shown in Figure 6. According to the Superposition Theorem, as the DC voltage increases, the voltage contributed to V_{FB} increases and the voltage drop on R2 decreases, i.e. the LED current decreases. For example, if the V_{DC} range is from 0V to 2.8V, the selection of resistors in Figure 6 sets dimming control of LED current from 20mA to 0mA.

Figure 6. Dimming Control Using a DC Voltage for RT9284A

The LED current can be calculated by the following equation.

$$I_{LED} = \frac{V_{FB} - \frac{R2 \times (V_{DC} - V_{FB})}{R3}}{R1}$$

c. Using a Filtered PWM signal :

Another common application is using a filtered PWM signal as an adjustable DC voltage for LED dimming control. A filtered PWM signal acts as the DC voltage to regulate the output current. The recommended application circuit is shown in the Figure 7. In this circuit, the output ripple depends on the frequency of PWM signal. For smaller output voltage ripple (<100mV), the recommended frequency of 2.8V PWM signal should be above 2kHz. To fix the frequency of PWM signal and change the duty cycle of PWM signal can get different output current. Figure 8. shows the relationship between LED current and PWM duty cycle.

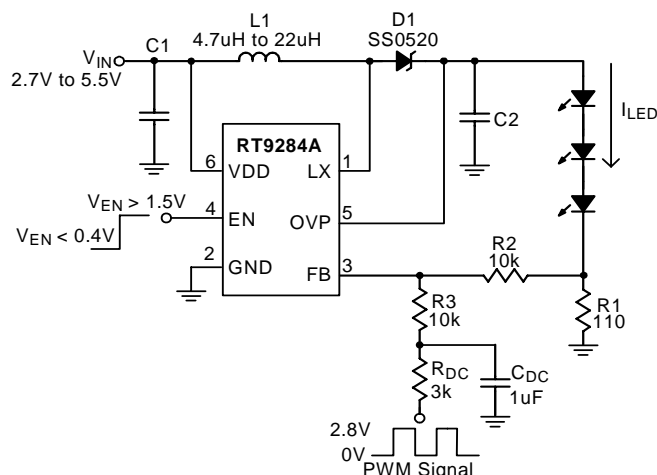

Figure 7. Filtered PWM Signal for LED Dimming Control of RT9284A

The LED current can be calculated by the following equation.

$$I_{LED} = \frac{V_{FB} - \frac{R_2 \times (V_{PWM} \times \text{Duty} - V_{FB})}{R_3 + R_{DC}}}{R_1}$$

Figure 8

Inductor Selection

The recommended value of inductor for 3 to 5 WLEDs applications are 4.7 to 22μH. Small size and better efficiency are the major concerns for portable device, such as RT9284A/B used for mobile phone. The inductor should have low core loss at 1.2MHz and low DCR for better efficiency. To avoid inductor saturation current rating should be considered.

Capacitor Selection

Input and output ceramic capacitors of 1μF are recommended for RT9284A/B applications. For better voltage filtering, ceramic capacitors with low ESR are recommended. X5R and X7R types are suitable because of their wider voltage and temperature ranges.

Diode Selection

Schottky diode is a good choice for RT9284A/B because of its low forward voltage drop and fast reverse recovery.

Using Schottky diode can get better efficiency. The high-speed rectification is also a good characteristic of Schottky diode for high switching frequency. Current rating of the diode must meet the root mean square of the peak current and output average current multiplication as following :

$$I_D(\text{RMS}) \approx \sqrt{I_{OUT} \times I_{PEAK}}$$

The diode's reverse breakdown voltage should be larger than the output voltage. SS0520 is recommended Schottky diode for rectifier.

Layout Guide

- ▶ A full GND plane without gap break.
- ▶ VCC to GND noise bypass—Short and wide connection for the 1μF MLCC capacitor between Pin6 and Pin2.
- ▶ Minimized LX node copper area to reduce EMI.
- ▶ Minimized FB node copper area and keep far away from noise sources.
