## Change Summary

Below are the changes from the March 2015 issue to the November 2020 issue

Page	Item	Change
81	Package Markings	Removed section 13; Package Markings

Below are the changes from the September 2014 issue to the March 2015 issue

Page	Item	Change
1	Added Features bullet	Included availability of customer defined default configurations
14, 21	Updated Section 4 and 5	Included availability of customer defined default configurations

Below are the changes from the June 2012 issue to the September 2014 issue

Page	Item	Change
1	Ordering Information	Removed ZL30327GGG (Leaded version) from the ordering information.
81	Package Markings	Added section 13; Package Markings

Below are the changes from the January 2012 issue to the June 2012 issue

Page	Item	Change
74	Output to Output Alignment	Added min/max values for $t_{OUT2OUTD}$
32 and 60	Register 0xC6 - Chip_Revision	Updated chip_revision register 0xC6 = 0x03

Below are the changes from the April 2011 issue to the January 2012 issue.

Page	Item	Change
1	Ordering Information	Corrected package description in ordering information to LPGA.
1, 9 14, 16, 74	All items related the maximum rate of differential output clocks	The maximum rate is updated from 720 MHz to 750MHz

Page	Item	Change
9, 10, 18, 19, 24, 34	All items related waiting time after pwr_b pin goes high during reset procedure	Waiting time after pwr_b pin goes high is changed from 30 ms to 50 ms
8, 9	Pin diagram Figure-2 and Pin description Table-1	Names for pin J1, J2, J9, J10, K1, K2, K9, and K10 are changed from 'IC' to 'NC'
1, 14, 68, 69	Synthesizer tuning range	changed from +/-5% to +/-0.5%
29	Procedure to write registers	Added a new procedure to update registers
30	Time between two write accesses to the same register	for register 0x0D there is no wait time
30	Reading from Sticky Read Registers	Updated sticky read procedure
30	Table-4	Heading of first column is changed from "Page_Addr" to "Reg_Addr"
34	Detailed Register Map	"Page_Address" is changed to "Register_Address" for registers which addresses are from 0x80 to 0x91
34	Register 0x00 id_reg	updated Ready bit description
34	Register 0x0D - Sticky_r_lock	Added register 0x0D
46	Register synth0_post_div_C	Bit[15:0]: note added for odd post divider
48	Register synth0_post_div_D	Bit[15:0]: note added for odd post divider
51	Register synth1_post_div_C	Bit[15:0]: note added for odd post divider
53	Register synth1_post_div_D	Bit[15:0]: note added for odd post divider
60	Register 0xC6	Updated chip_revision register
69	Register 0xF7 - spurs_suppression	Updated register description
71	DC Electrical Characteristics -Power Core	<ul style="list-style-type: none"> <li>• "Power for Each Synthesis Engine" is changed to "Current for Each Synthesis Engine"</li> <li>• "PSYN" is changed to "ISYN"</li> </ul>
71	DC Electrical Characteristics - High Performance Outputs	Note added for differential output voltage when differential frequency is higher than 720MHz
71	DC Electrical Characteristics	All "AV <sub>DD-IO</sub> " symbols are replaced with "AV <sub>DD</sub> "
78	Section 10.1	The section was renamed to "Output Clocks RMS Jitter Generation"
78	Section 10.2	Table 9 was created for cycle-to-cycle jitter generation
79	Section 11.0	Note added for Tjmax

Page	Item	Change
80	Section 12.0	Replaced drawing to reflect correct package description

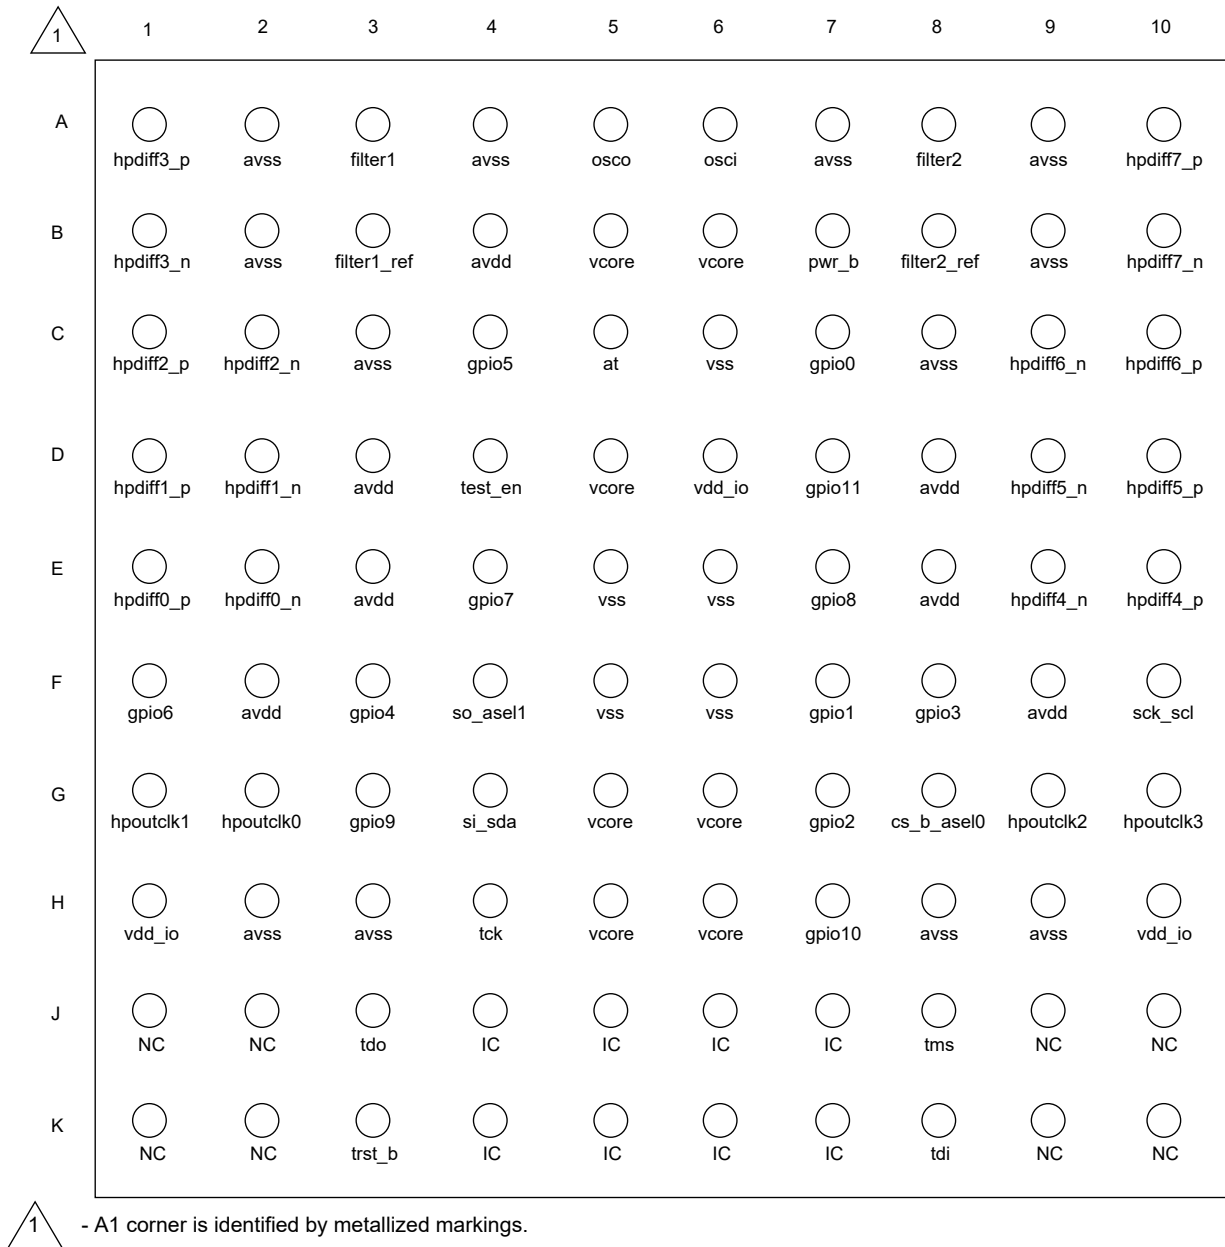

Below are the changes from the March 2011 issue to the April 2011 issue.

Page	Item	Change
74	Table 7	1) Type of jitter values was changed from "Typ." to "Max" 2) Jitter values were updated
74	Table 8	1) Type of jitter values was changed from "Typ." to "Max" 2) Jitter values (except 25 MHz) were updated 3) Jitter measurement filter for 77.76 MHz was changed from "12 kHz - 5 MHz" to "12 kHz - 20 MHz"

Below are the changes from the January 2011 issue to the March 2011 issue.

Page	Item	Change
1	Features	Max. rate for LVCMOS outputs was changed to 177.5 MHz.
25	Time between two write accesses to the same register	Waiting time for frequency adjustment registers accesses was updated to 0.1 ms.  No waiting time is required for page_register accesses.  Waiting time for the other registers accesses was updated to 5 ms.
26	Reading from Sticky Read (StickyR) registers	Waiting time within the procedure was changed to 5 ms.
26	Table- 4 Register Map	The default value of register "id_reg" was changed to "0x0A".
27	Table- 4 Register Map	Added an entry for new register: chip_revision at address 0xC6.
29	Reregistered 0x00, Default value	The default value was changed to "0x0A"
29	Register_address 0x00, Bit filed	Bit 6:5 default value was changed to "0b00".  Added note for referring register "chip_revision" at address 0xC6.
54	Register_address 0xC6	Added new register: chip_revision.
71	10.0 Performance Characterization	Jitter value was changed to "Typ."
71	10.0 Performance Characterization	Jitter value for 25 MHz HPOUT was changed to 0.99 ps.

## 1.0 Pin Diagram

**Figure 2 - Package Description**

## 2.0 Pin Description

All device inputs and output are LVCMOS unless it was specifically stated to be differential.

Ball #	Name	I/O	Description
<b>Output Clocks</b>			
G2 G1 G9 G10	hpoutclk0 hpoutclk1 hpoutclk2 hpoutclk3	O	<p><b>High Performance Output Clock 0 to 3.</b> This output can be configured to provide any one of the single ended high performance clock outputs.</p> <p>Maximum frequency limit on single ended LVCMOS outputs is 177.5 MHz</p>
E1 E2 D1 D2 C1 C2 A1 B1 E10 E9 D10 D9 C10 C9 A10 B10	hpdiff0_p hpdiff0_n hpdiff1_p hpdiff1_n hpdiff2_p hpdiff2_n hpdiff3_p hpdiff3_n hpdiff4_p hpdiff4_n hpdiff5_p hpdiff5_n hpdiff6_p hpdiff6_n hpdiff7_p hpdiff7_n	O	<p><b>High Performance Differential Output Clock 0 to 7 (LVPECL).</b> This output can be configured to provide any one of the available high performance differential output clocks.</p> <p>Maximum frequency limit on differential outputs is 750 MHz</p>
<b>Control and Status</b>			
B7	pwr_b	I	<p><b>Power-on Reset.</b> A logic low at this input resets the device. To ensure proper operation, the device must be reset after power-up. The pwr_b pin should be held low for 2 ms. Following a reset, the input reference source and output clocks are phase aligned. This pin is internally pulled-up to <math>V_{DD}</math>. <b>User can access device registers either 50 ms after pwr_b goes high, or after bit 7 in register at address 0x00 goes high which can be determined by polling the register at address 0x00.</b></p>

Table 1 - Pin Description

Ball #	Name	I/O	Description
C7 F7 G7 F8 F3 C4 F1 E4 E7 G3 H7 D7	gpio0 gpio1 gpio2 gpio3 gpio4 gpio5 gpio6 gpio7 gpio8 gpio9 gpio10 gpio11	I/O	<p><b>General Purpose Input and Output pins.</b> These are general purpose pins managed by the internal processor based on device configuration. Other status and control pins could be muxed to become part of the available GPIO pins.</p> <p>Recommended usage of GPIO include:</p> <ul style="list-style-type: none"> <li>Differential output clock enable (per output or as a bank of 2 or 4 outputs)</li> <li>High performance LVCMOS outputs enable</li> <li>Microport interface protocol I2C or SPI</li> <li>Master Clock frequency rate</li> </ul> <p>Pins 5:0 are internally pulled down to GND and pins 11:6 are internally pulled up to <math>V_{DD}</math>.</p> <p>If not used GPIO can be kept unconnected.</p> <p><b>After power on reset, device GPIOs configure some of device basic functions, GPIO[3] set I2C or SPI control mode, GPIO[1,0] set master clock rate selection. The GPIO[0,1,3] pins must be either pulled low or high with an external 1 K<math>\Omega</math> resistor as needed for their assigned functions at reset; or they must be driven low or high for 50 ms after reset, and released and used for normal GPIO functions.</b></p> <p><b>The GPIO[4,5] pins must be either pulled low with external 1 K<math>\Omega</math> resistors; or they must be driven low for 50 ms after reset, and then released and used for normal GPIO functions.</b></p>
<b>Host Interface</b>			
F10	sck_scl	I/O	<b>Clock for Serial Interface.</b> Provides clock for serial micro-port interface. This pin is also the serial clock line (SCL) when the host interface is configured for I2C mode. As an input this pin is internally pulled up to $V_{DD}$ .
G4	si_sda	I/O	<b>Serial Interface Input.</b> Serial interface input stream. The serial data stream holds the access command, the address and the write data bits. This pin is also the serial data line (SDA) when host interface is configured for I2C mode. This pin is internally pulled up to $V_{DD}$ .
F4	so_ase1	I/O	<b>Serial Interface Output.</b> Serial interface output stream. As an output the serial stream holds the read data bits. This pin is also the I2C address select when host interface is configured for I2C mode.
G8	cs_b_ase0	I	<b>Chip Select for Serial Interface.</b> Serial interface chip select, this is an active low signal. This pin is also the I2C address select when host interface is configured for I2C mode. This pin is internally pulled up to $V_{DD}$ .
<b>APLL Loop Filter</b>			
A3	filter1	A	<b>External Analog PLL1 Loop Filter terminal.</b>
B3	filter1_ref	A	<b>Analog PLL1 External Loop Filter Reference.</b>
A8	filter2	A	<b>External Analog PLL2 Loop Filter terminal.</b>

Table 1 - Pin Description (continued)

Ball #	Name	I/O	Description
B8	filter2_ref	A	<b>Analog PLL2 External Loop Filter Reference.</b>
<b>JTAG (IEEE 1149.1) and Test</b>			
D4	test_en	I	<b>Test Mode Enable.</b> A logic high at this pin enables device test modes. This pin is internally pulled down to GND. Connect this pin to GND.
C5	at	A-I/O	<b>Analog PLL Test.</b> Test pin for analog PLL.
J3	tdo	O	<b>Test Serial Data Out.</b> JTAG serial data is output on this pin on the falling edge of tck. This pin is held in high impedance state when JTAG scan is not enabled.
K8	tdi	I	<b>Test Serial Data In.</b> JTAG serial test instructions and data are shifted in on this pin. This pin is internally pulled up to $V_{DD}$ . If this pin is not used then it should be left unconnected.
K3	trst_b	I	<b>Test Reset.</b> Asynchronously initializes the JTAG TAP controller by putting it in the Test-Logic-Reset state. This pin should be pulsed low on power-up to ensure that the device is in the normal functional state. This pin is internally pulled up to $V_{DD}$ . If this pin is not used then it should be connected to GND.
H4	tck	I	<b>Test Clock.</b> Provides the clock to the JTAG test logic. This pin is internally pulled up to $V_{DD}$ . This pin is internally pulled up to $V_{DD}$ . If this pin is not used then it should be connected to GND.
J8	tms	I	<b>Test Mode Select.</b> JTAG signal that controls the state transitions of the TAP controller. This pin is internally pulled up to $V_{DD}$ . If this pin is not used then it should be left unconnected.
<b>Master Clock</b>			
A5	osco	A-O	<b>Oscillator Master Clock.</b> For crystal operation, a crystal is connected from this pin to osci. Not suitable for driving other devices. For clock oscillator operation, this pin is left unconnected.
A6	osci	I	<b>Oscillator Master Clock.</b> For crystal operation, a crystal is connected from this pin to osco. For clock oscillator operation, this pin is connected to a clock source.
<b>Miscellaneous</b>			
J4 K4 J5 K5 K6 J6 K7 J7	IC		<b>Internal Connect.</b> Connect to GND.

Table 1 - Pin Description (continued)

Ball #	Name	I/O	Description
J1 J2 K1 K2 K9 K10 J10 J9	NC		<b>No Connection.</b> Leave unconnected.
<b>Power and Ground</b>			
D6 H1 H10	$V_{DD-IO}$		<b>Positive Supply Voltage IO.</b> $3.3V_{DC}$ nominal.
D5 G5 G6 B5 B6 H5 H6	$V_{CORE}$		<b>Positive Supply Voltage.</b> $+1.8V_{DC}$ nominal. These pins should not be connected together on the board. Please refer to ZLAN-269 for recommendations.
B4 D3 D8 E3 E8 F2 F9	$AV_{DD}$		<b>Positive Analog Supply Voltage.</b> $+3.3V_{DC}$ nominal.
C6 E5 E6 F5 F6	$V_{SS}$		<b>Ground.</b> 0 Volts.
A2 A4 A7 A9 B2 B9 C3 C8 H2 H3 H8 H9	$AV_{SS}$		<b>Analog Ground.</b> 0 Volts.

Table 1 - Pin Description (continued)

### 3.0 Application Example

The device has two independent Numerically Controlled Oscillators (NCOs), both locked to the external xtal or oscillator. Each NCO can be used as a free running clock generator or it can be used to build a Phase Locked Loop (PLL) where phase detector and loop filter are provided externally. An example of this application is shown in Figure 3 where each ZL30237 is used to build two PLLs which are used to clean gapped clock recovered in OTN demapper.

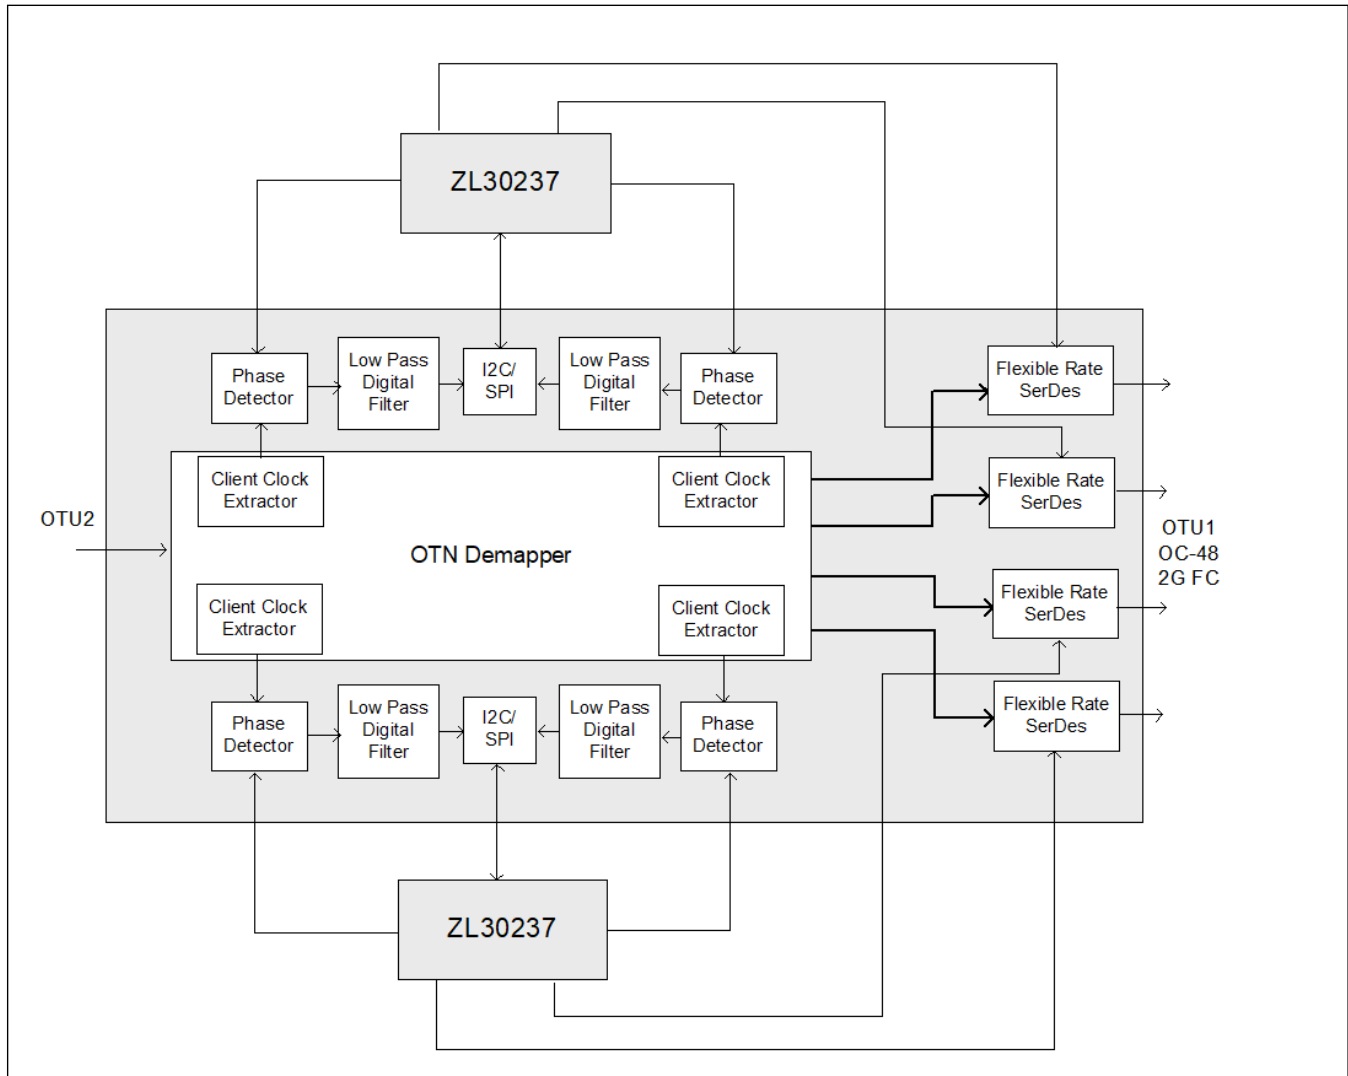

Figure 3 - Application Diagram

## 4.0 Functional Description

The functional block diagram of the ZL30237 is shown in Figure 1. The ZL30237 is a Dual Channel Universal NCO Clock Generator that can be configured by any of the following methods: power-up with its default configuration; power-up with a custom OTP (One Time Programmable) configuration; after power-up it can be dynamically configured via the SPI/I2C port. Configurations set via the SPI/I2C port are volatile and will need to be rewritten if the device is reset or powered-down. The SPI/I2C port is also used to access the status registers.

### 4.1 Frequency Synthesis Engine

The device has two ultra low jitter synthesis engines. Each frequency synthesis engine is comprised of a hardware NCO and an analog jitter filtering APLL with built-in digital jitter attenuation scheme. Output clocks of the device meet the jitter generation requirements detailed in section 10.0, "Performance Characterization".

The frequency synthesis engines can generate any clock which is  $(M/N \times 1 \text{ kHz})$  multiple (FEC rate converted clock). The M and N are 16 bits wide. Each frequency engine can also be fine tuned dynamically with resolution of 0.02Hz and range of  $\pm 0.5\%$  by programming corresponding synthesizer frequency adjustment registers.

### 4.2 Dividers and Skew Management

The device has 4 independent dividers associated with each frequency synthesis engine.

The divider engines associated with the high performance differential outputs generate output clocks between 1 kHz and 750 MHz with 50% duty cycle. The other divider engines generate output clocks between 1 kHz and 177.5 MHz with 50% duty cycle.

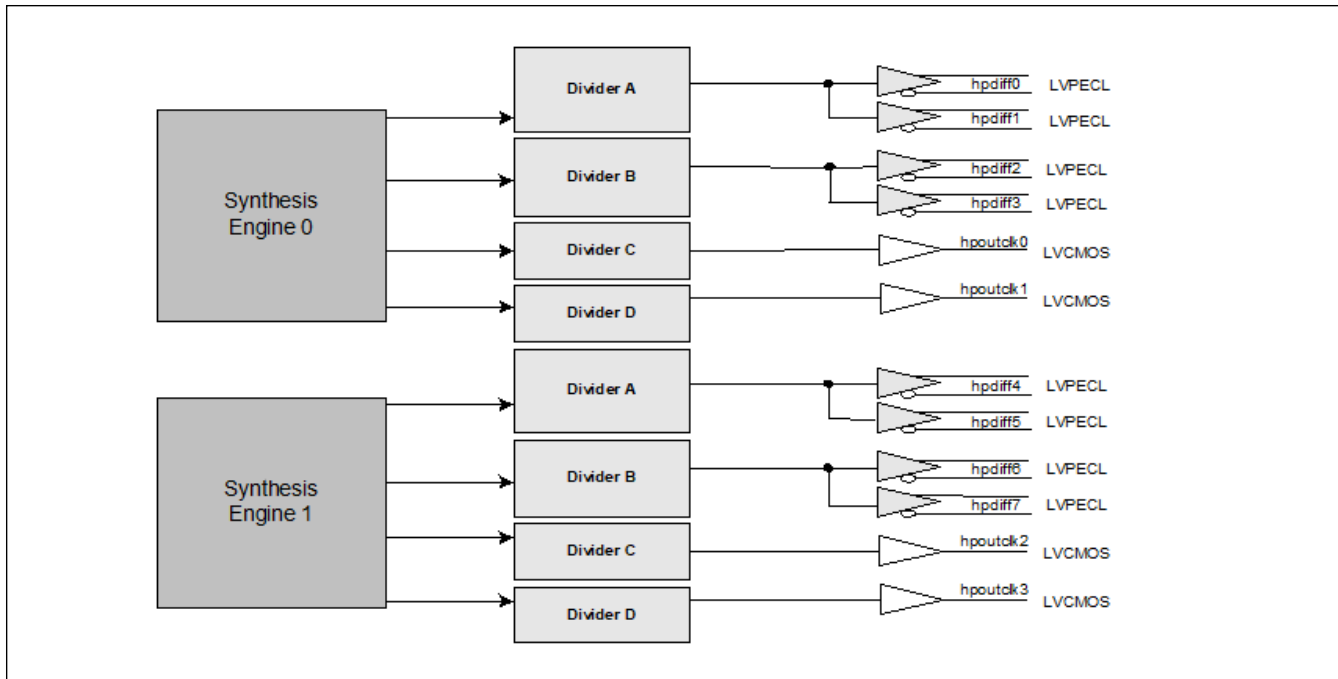

The divider modules generating the single ended output clocks provides the ability to manage the phase skew of the output clock by a coarse step equal to the internal high speed clock period.

The single ended generated output clocks can be stopped either on rising or falling edge (programmed through serial interface or GPIO).

The device can be configured to adjust the phase skew of single ended clocks in steps of sub high speed synthesizer clock cycle.

### 4.3 Output Multiplexer

Figure 4 shows the multiplexing configuration supported.

**Figure 4 - Output Clock Muxing Configuration**

#### 4.4 Output Drivers

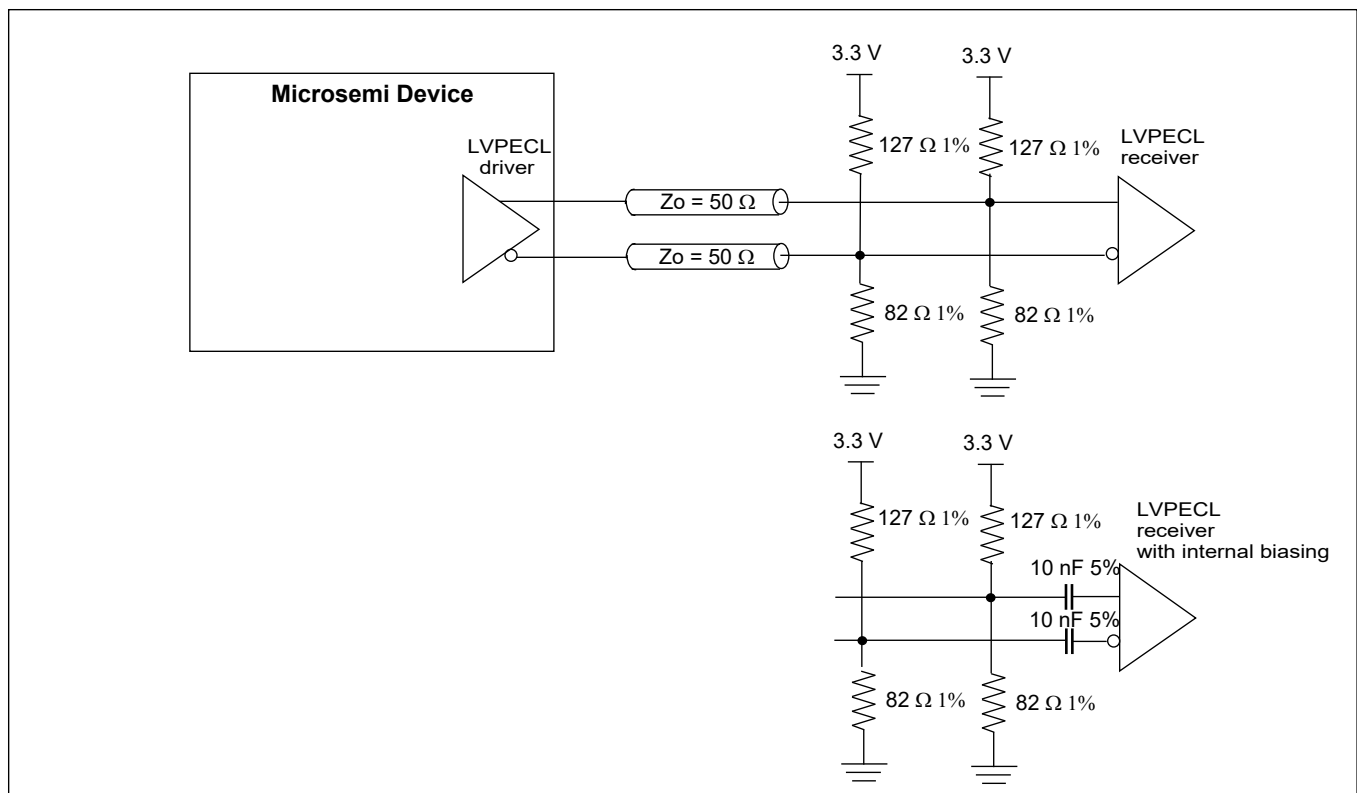

The device has 8 high performance (HP) differential (LVPECL) outputs.

The device has 4 high performance (HP) single ended (LVCMOS) outputs.

High Performance (HP) single ended driver (LVCMOS) supports the jitter specification detailed in section 10.0, "Performance Characterization" and a maximum speed of 177.5 MHz.

The high performance (HP) differential driver (LVPECL) supports the jitter specification detailed in section 10.0, "Performance Characterization" and a maximum speed of 750 MHz.

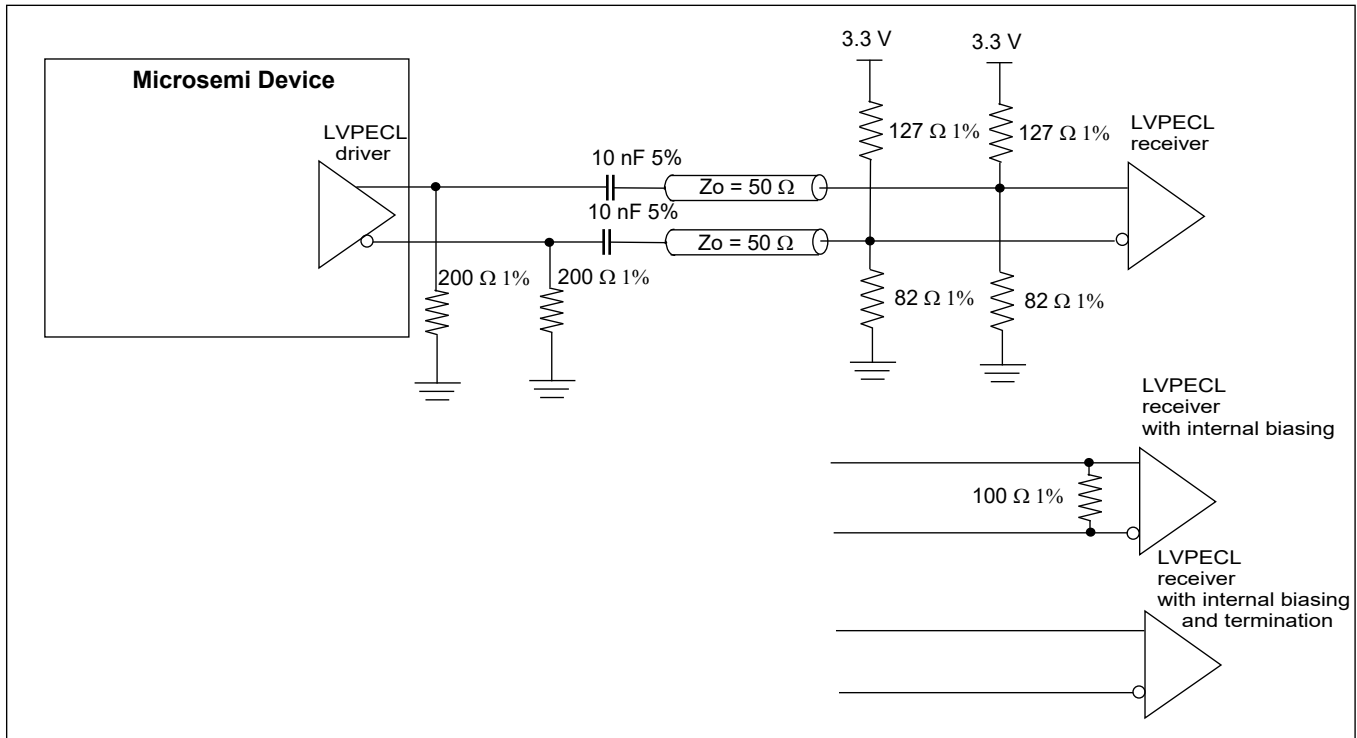

LVPECL outputs should be terminated as shown in Figure 5. Terminating resistors provide 50  $\Omega$  equivalent Thevenin termination as well as biasing for the output LVPECL driver. Terminating resistors should be placed as close as possible to input pins of the LVPECL receiver. If the LVPECL receiver has internal biasing then AC coupling capacitors should be added.

**Figure 5 - Terminating LVPECL Outputs**

If the transmission line is required to be AC coupled then the termination shown in Figure 6 should be implemented. 200  $\Omega$  resistors are used to provide DC biasing for LVPECL driver. Both AC coupling capacitor and biasing resistors should be placed as close as possible to output pins.

Thevenin termination (127  $\Omega$  and 82  $\Omega$  resistors) provide 50  $\Omega$  termination as well as biasing of the input LVPECL receiver. If the LVPECL receiver has internal DC biasing then the line should be terminated with 100  $\Omega$  termination resistor between positive and negative input. In both cases termination resistors should be placed as close as possible to the LVPECL receiver pins. Some LVPECL receivers have internal biasing and termination. In this case no external termination should be present.

**Figure 6 - Terminating AC coupled LVPECL Outputs**

High performance LVCMOS outputs (hpoutclkx) should be terminated at the source with 22 Ω resistor as shown in Figure 7.

**Figure 7 - Terminating LVCMOS Outputs**

#### 4.5 Master Clock Interface

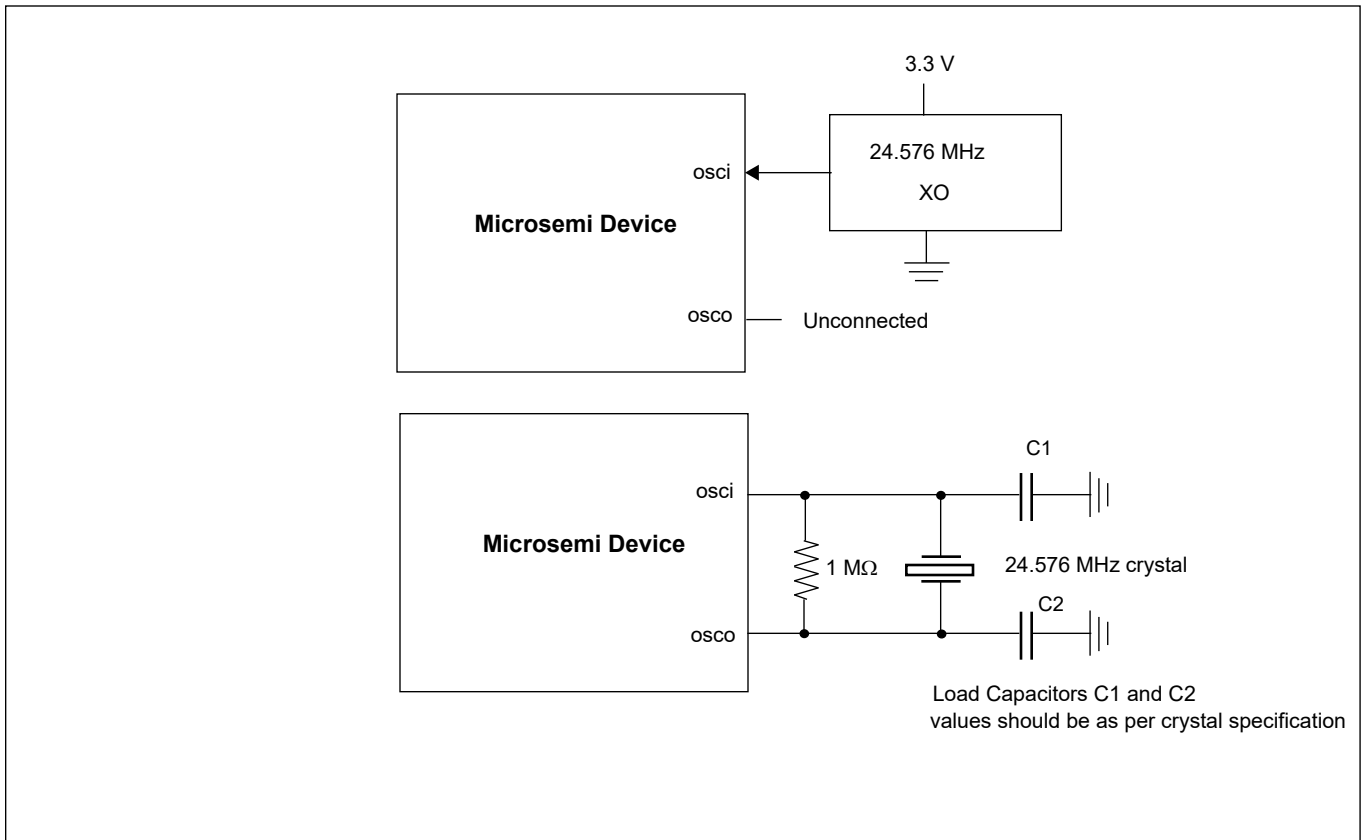

The master oscillator determines the device free-run frequency accuracy and holdover stability. The reference monitor circuitry also uses this frequency as its point of reference (0 ppm) when making frequency measurements. The master clock interface was designed to accept either a free-running clock oscillator (XO) or a crystal (XTAL). Refer to Application Note ZLAN-68 for a list of recommended clock oscillators and crystals.

#### 4.6 Clock Oscillator and Crystal Circuit

When using a clock oscillator as the master timing source, connect the oscillator's output clock to the **osci** pin as shown in Figure 8. The connection to **osci** should be direct and not AC coupled. The **osco** pin must be left unconnected.

When using crystal resonator as the master timing source, connect crystal between **osci** and **osco** pins as shown in Figure 8. Crystal should have bias resistor of 1 M $\Omega$  and load capacitances C1 and C2. Value of load capacitances is dependent on crystal and should be as per crystal datasheet. Crystal should be a fundamental mode type -- not an overtone. See ZLAN-68 for crystal recommendation.

**Figure 8 - Clock Oscillator Circuit**

The device internal system clocks are generated off the device master clock input (Oscillator or a crystal employing an on-chip buffer/driver). The master clock selection is done at start-up using the available GPIO pins, right after **pwr\_b** get de-asserted. To select 24.576 MHz oscillator, GPIO[1:0] pins need to be held high for 50 ms after the de-assertion of **pwr\_b**, after which time they can be released and used as any other GPIO. Alternatively, these pins can be pulled high with 1 K $\Omega$  resistors.

GPIO [1:0]	Master Clock Frequency
0	reserved
1	reserved
2	reserved
3	24.576 MHz

**Table 2 - Master Clock Frequency Selection**

#### 4.7 Power Up/Down Sequence

The 3.3 V supply should be powered before or simultaneously with the 1.8 V supply. The 1.8V supply must never be greater than the 3.3 V supply by more than 0.3 V.

The power-down sequence is less critical, however it should be performed in the reverse order to reduce transient currents that consume power.

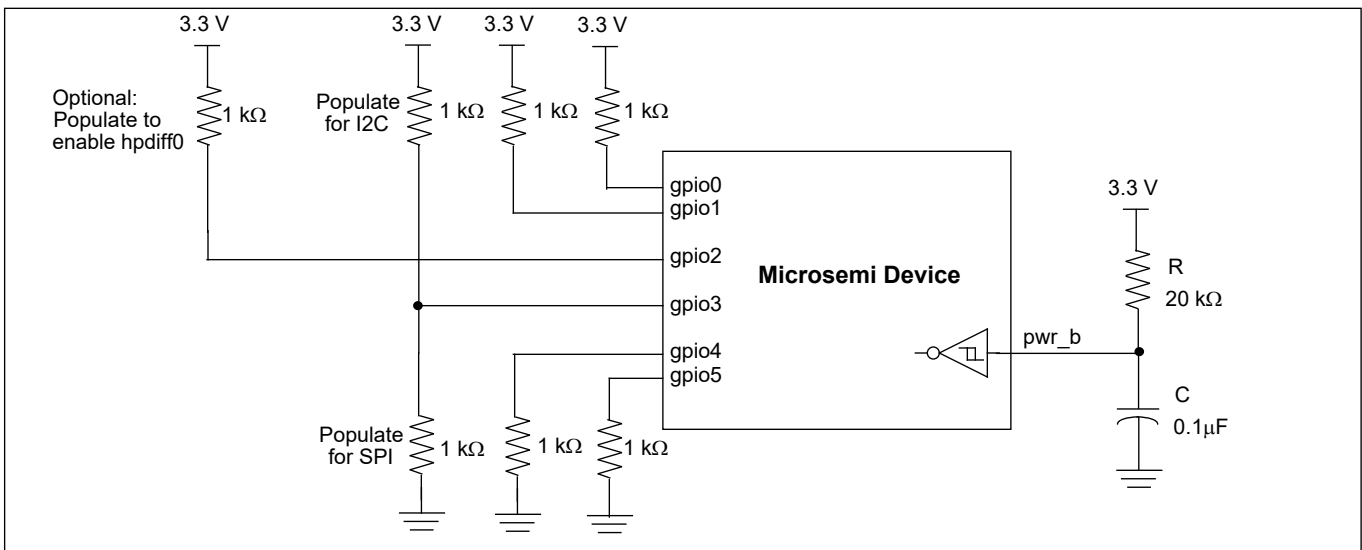

#### 4.8 Power Supply Filtering

Jitter levels on the output clocks may increase if the device is exposed to excessive noise on its power pins. For optimal jitter performance, the device should be isolated from noise on power planes connected to its 3.3 V and 1.8 V supply pins. For recommended common layout practices, refer to Application Note ZLAN-269.

#### 4.9 Power on Reset and Initialization Circuit

To ensure proper operation, the device must be reset by holding the pwr\_b pin low for at least 2 ms after power-up when 3.3 V and 1.8 V supplies are stable. Following reset, the device will operate under specified default settings.

The reset pin can be controlled with on-board system reset circuitry or by using a stand-alone power-up reset circuit as shown in Figure 9. This circuit provides approximately 2 ms of reset low time. The pwr\_b input has Schmidt trigger properties to prevent level bouncing.

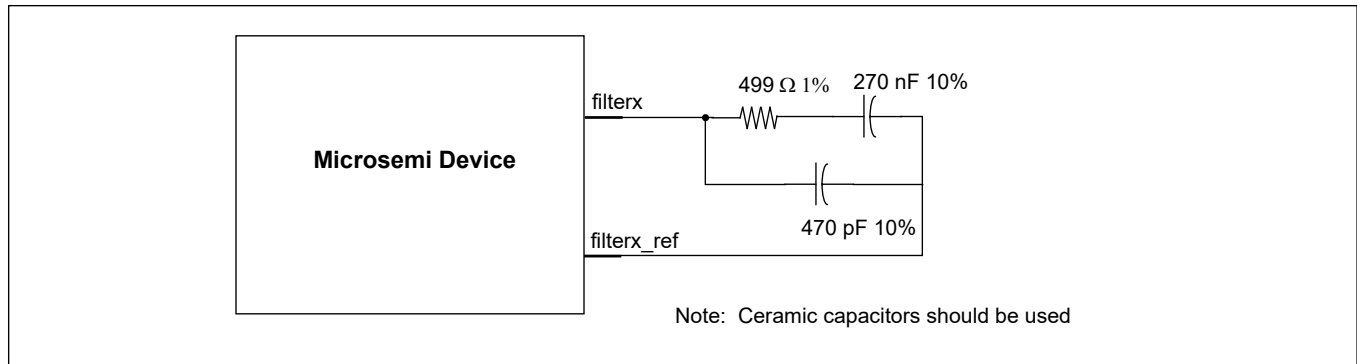

**Figure 9 - Typical Power-Up Reset and Configuration Circuit**

General purpose pins gpio[0,1,3,4,5] are used to configure device on the power up. They have to be pulled up/down with 1 KΩ resistors as shown in Figure 9 or they can be pulsed low/high during the pwr\_b low pulse and kept at the same level for at least 50 ms after pwr\_b goes high. After 50 ms they can be released and used as general purpose I/O as described in section 5.0.

By default all outputs are disabled to allow user first to program required frequencies for different outputs and then to enable corresponding outputs. During the prototype phase, hardware designer can verify if the device is working properly even before software driver is implemented just by pulling up gpio2 pin which enables hpdif0 output (generates 622.08 MHz by default).

#### 4.10 Ultra Low Jitter Synthesizer Filter Components and Recommended Layout

The low jitter APLL has an on-chip loop filter, but for optimal APLL jitter performance external loop filter is recommended, the following component values are recommended:

**Figure 10 - APLL Filter Component Values**

Recommended layout for loop filters is shown in Figure 11:

**Figure 11 - Recommended layout for loop filters**

## 5.0 Configuration and Control

### 5.1 Configuration Registers

The ZL30237 configuration is composed of 253 x 8 bits. The configuration registers are assigned their values by any of the following three methods:

- 1) Default configuration
- 2) Custom OTP (One Time Programmable) configuration
- 3) SPI/I2C configuration

#### 5.1.1 Default Configuration

At power-up the device sets its configuration registers to the default reset values.

#### 5.1.2 Custom OTP Configuration

At power-up the device sets its configuration registers to the user defined custom configuration values stored in its one time programmable memory. Custom configurations can be generated using Microsemi's Clockcenter GUI (ZLS30CLKCTR). For custom configured devices contact your local Microsemi Field Applications Engineer or Sales Manager.

#### 5.1.3 SPI/I2C Configuration

After power-up the values of R/W type configuration registers can be dynamically written via the SPI/I2C port. Configurations set via the SPI/I2C port are volatile and will need to be rewritten if the device is reset or powered down.

#### 5.1.4 Output Multiplexer Configuration and Programmability

The following is the set of parameters that are configurable:

- Output multiplexer configuration
- Start or Stop clock.

#### 5.1.5 Synthesizer 0 and 1 Configuration and Programmability

The following is the set of parameters that are configurable:

- Synthesizer 0 and 1 output frequency between 1.0 GHz and 1.5 GHz.
- Synthesizer 0 and 1 high speed output clock, defined as a 1 kHz multiple and 1 kHz multiple with M/N ratio
- Synthesizer 0 and 1 output frequency fine tuning with resolution of 0.024Hz

#### 5.1.6 Output Dividers and Skew Management Configuration and Programmability

The following is the set of parameters that are configurable:

- Post divider enable/disable
- Divider ratio (2 different settings, independent for each one of the divider outputs)
- Output delay value

#### 5.1.7 Output Drivers configuration and Programmability

The following is the set of parameters that are configurable:

- Output driver Enable/Disable

## 5.2 GPIO Configuration and Programmability

The device GPIO is mapped by the SPI/I2C programmability. The following is an example of control signals that can be supported:

- Differential output clock enable (per output or as a bank of 2 or 4 outputs)
- Host Interrupt Output: flags changes of device status prompting the processor to read the enabled interrupt service registers (ISR).
- Output clock stop/start
- Microport Interface Protocol I2C or SPI

The following table defines the function of the GPIO pin when configured as a control pin. Configuring the value in bit 6:0 in GPIO configuration registers enables the stated function.

Value	Name	Description
<b>Default</b>		
0x00	default	GPIO pin defined as an input and no function assigned to it.
<b>Synthesizer Post Divider</b>		
0x44	Stop output clock from Synthesizer0 Post Divider C bit1	This signal is OR-ed with the 'Synthesizer0 Post Divider C stop clock' bit1 in the 'Synthesizer0 and Synthesizer1 Post Dividers stop clock' register.
0x45	Stop output clock from Synthesizer0 Post Divider C bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x46	Stop output clock from Synthesizer0 Post Divider D bit1	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x47	Stop output clock from Synthesizer0 Post Divider D bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x4C	Stop output clock from Synthesizer1 Post Divider C bit1	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x4D	Stop output clock from Synthesizer1 Post Divider C bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x4E	Stop output clock from Synthesizer1 Post Divider D bit1	Same description as Stop output clock Synthesizer0 Post Divider C bit1
0x4F	Stop output clock from Synthesizer1 Post Divider D bit0	Same description as Stop output clock Synthesizer0 Post Divider C bit1
<b>High Performance Differential Outputs</b>		
0x60	Enable Differential output HPDIFF0	This signal is OR-ed with the 'Enable HPDIFF0' bit in the 'High performance differential output enable' register. Functionality of this signal is explained in hpdif_en register.

Value	Name	Description
0x64	Enable Differential output HPDIFF1	Same description as Enable Differential output HPDIFF0
0x68	Enable Differential output HPDIFF2	Same description as Enable Differential output HPDIFF0
0x6C	Enable Differential output HPDIFF3	Same description as Enable Differential output HPDIFF0
<b>High Performance CMOS Outputs</b>		
0x70	Enable HPOUTCLK0	This signal is OR-ed with the 'Enable HPOUTCLK0' bit in the 'High performance CMOS output enable' register.
0x72	Enable HPOUTCLK1	Same description as Enable HPOUTCLK0
0x74	Enable HPOUTCLK2	Same description as Enable HPOUTCLK0
0x76	Enable HPOUTCLK3	Same description as Enable HPOUTCLK0

## 6.0 Host Interface

A host processor controls and receives status from the Microsemi device using either a SPI or an I<sup>2</sup>C interface. The type of interface is selected using the startup state of the GPIO pins.

**Figure 12 - Serial Interface Configuration**

The selection between I2C and SPI interfaces is performed at start-up using GPIO[3] pin, right after pwr\_b gets de-asserted. The GPIO pin need to be held at their appropriate value for 50 ms after the de-assertion of pwr\_b, after which time they can be released and used as any other GPIO.

Both interfaces use seven bit address field and the device has eight bit address space. Hence, memory is divided in two pages. Page 0 with addresses 0x00 to 0x7E and Page 1 with addresses 0x80 to 0xFF. Writing 0x01 to Page Register at address 0x7F, toggles SPI/I2C accesses between Page 0 and Page 1.

GPIO[3]	Serial Interface
0	SPI
1	I2C

**Table 3 - Serial Interface Selection**

### 6.1 Serial Peripheral Interface

The serial peripheral interface (SPI) allows read/write access to the registers that are used to configure, read status, and allow manual control of the device.

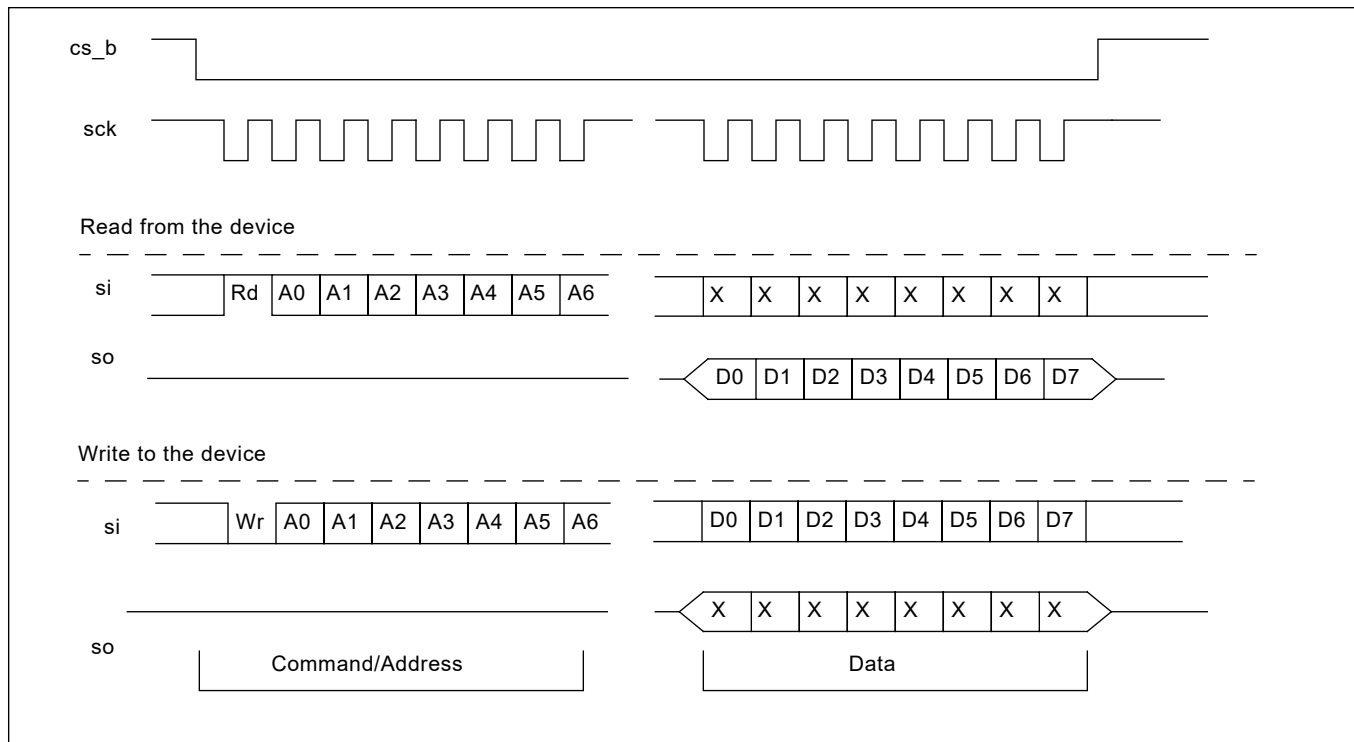

This interface supports two modes of access: Most Significant Bit (MSB) first transmission or Least Significant Bit (LSB) first transmission. The mode is automatically selected based on the state of **sck\_scl** pin when the **cs\_b\_asel0** pin is active. If the **sck\_scl** pin is low during **cs\_b\_asel0** activation, then MSB first timing is selected. If the **sck\_scl** pin is high during **cs\_b\_asel0** activation, then LSB first timing is assumed.

The SPI port expects 7-bit addressing and 8-bit data transmission, and is reset when the chip select pin **cs\_b\_asel0** is high. During SPI access, the **cs\_b\_asel0** pin must be held low until the operation is complete. The first bit transmitted during the address phase of a transfer indicates whether a read (1) or a write (0) is being performed. Burst read/write mode is also supported by leaving the chip select signal **cs\_b\_asel0** low after a read or a write. The address will be automatically incremented after each data byte is read or written.

The serial peripheral interface supports half-duplex processor mode which means that during a write cycle to the device, output data from the **so\_asel1** pin must be ignored. Similarly, the input data on the **si\_sda** pin is ignored by the device during a read cycle.

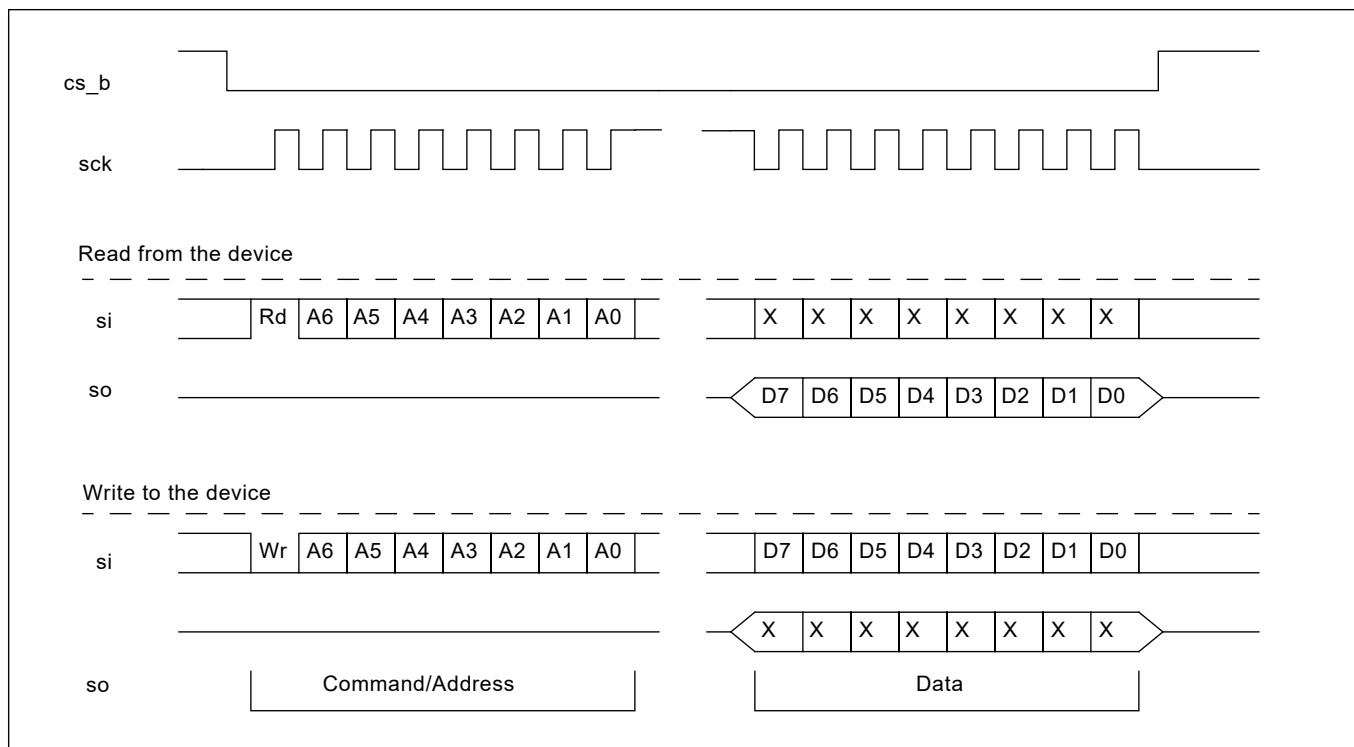

Functional waveforms for the LSB and MSB first mode, and burst mode are shown in Figure 13, Figure 14 and Figure 15. Timing characteristics are shown in Table 5, Figure 24 and Figure 25.

### 6.1.1 Least Significant Bit (LSB) First Transmission Mode

**Figure 13 - Serial Peripheral Interface Functional Waveforms - LSB First Mode**

### 6.1.2 Most Significant Bit (MSB) First Transmission Mode

**Figure 14 - Serial Peripheral Interface Functional Waveforms - MSB First Mode**

### 6.1.3 SPI Burst Mode Operation

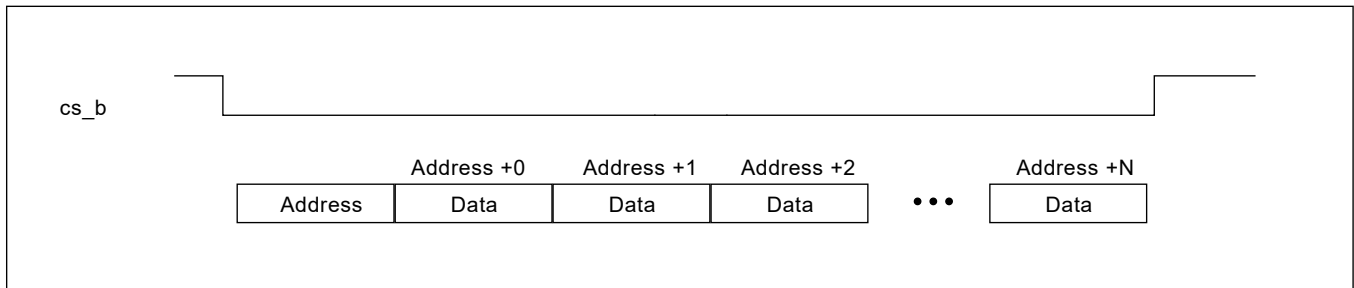

Figure 15 - Example of a Burst Mode Operation

### 6.1.4 I<sup>2</sup>C Interface

The I<sup>2</sup>C controller supports version 2.1 (January 2000) of the Philips I<sup>2</sup>C bus specification. The port operates in slave mode with 7-bit addressing, and can operate in Standard (100 kbits/s) and Fast (400 kbits/s) mode. Burst mode is supported in both standard and fast modes.

Data is transferred MSB first and occurs in 1 byte blocks. As shown in Figure 16, a **write** command consists of a 7-bit device (slave) address, a 7-bit register address (0x00 - 0x7F), and 8-bits of data.

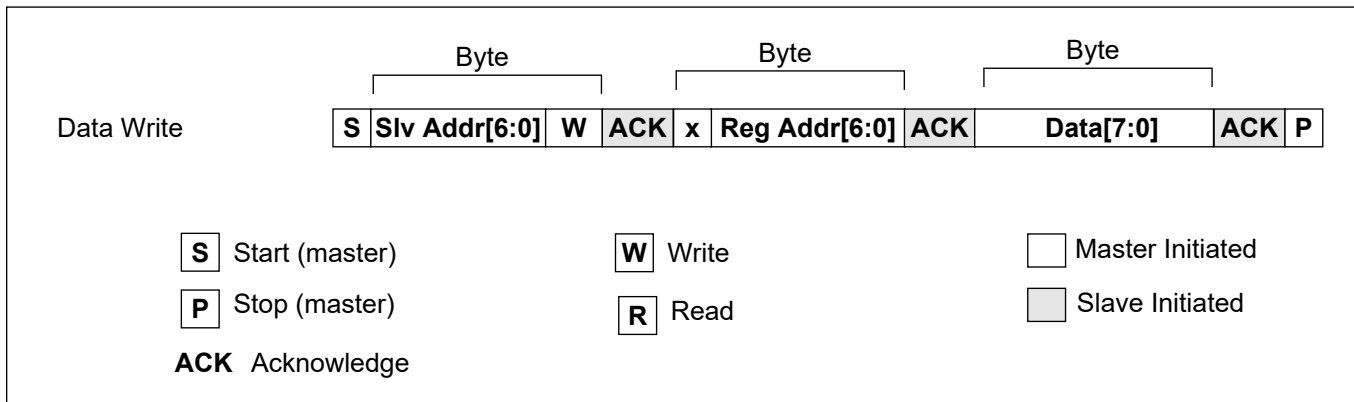

Figure 16 - I<sup>2</sup>C Data Write Protocol

A **read** is performed in two stages. A data write is used to set the register address, then a data read is performed to retrieve the data from the set address. This is shown in Figure 17.

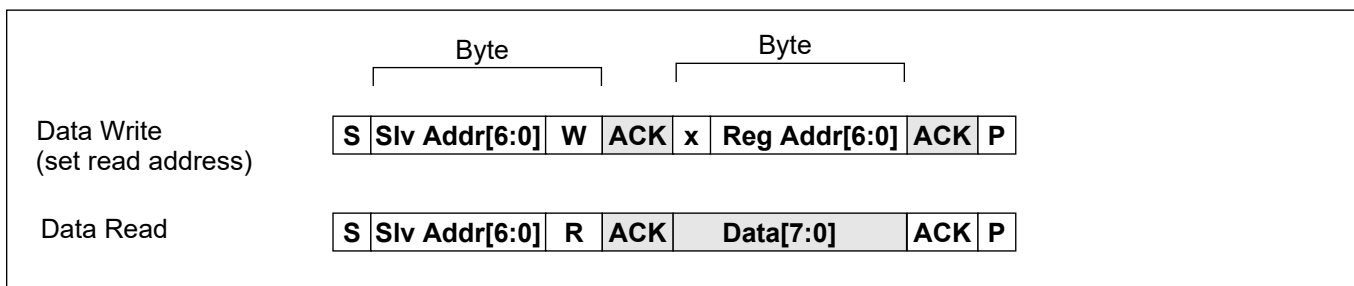

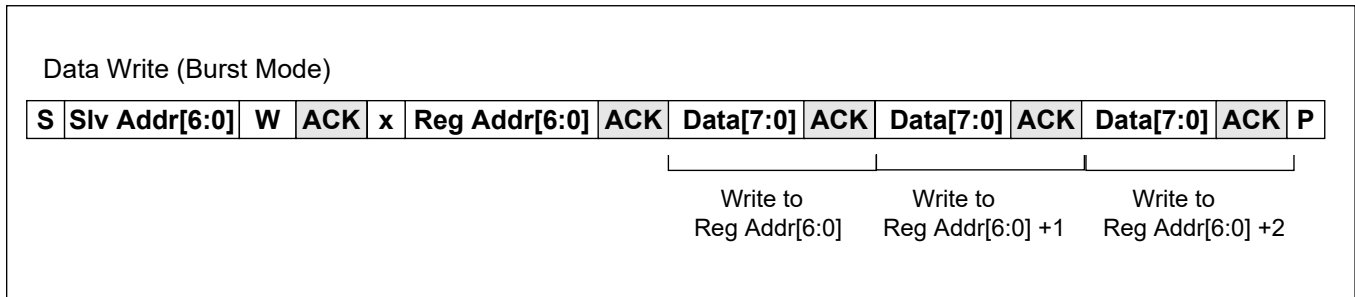

Figure 17 - I<sup>2</sup>C Data Read Protocol

The **7-bit device (slave) address** contains a 5-bit fixed address plus variable bits which are set with the **asel0**, and **asel1** pins. This allows multiple similar devices to share the same I<sup>2</sup>C bus. The address configuration is shown in Figure 18.

**Figure 18 - I<sup>2</sup>C 7-bit Slave Address**

The device also supports burst mode which allows multiple data write or read operations with a single specified address. This is shown in Figure 19 (write) and Figure 20 (read). The first data byte is written/read from the specified address, and subsequent data bytes are written/read using an automatically increment address. The maximum auto increment address of a burst operation is 0x7F. Any operations beyond this limit will be ignored. In other words, the auto increment address does not wrap around to 0x00 after reaching 0x7F.

## 7.0 Register Map

The device is mainly controlled by accessing software registers through the serial interface (SPI or I<sup>2</sup>C). The device can be configured to operate in a highly automated manner which minimizes its interaction with the system's processor, or it can operate in a manual mode where the system processor controls most of the operation of the device.

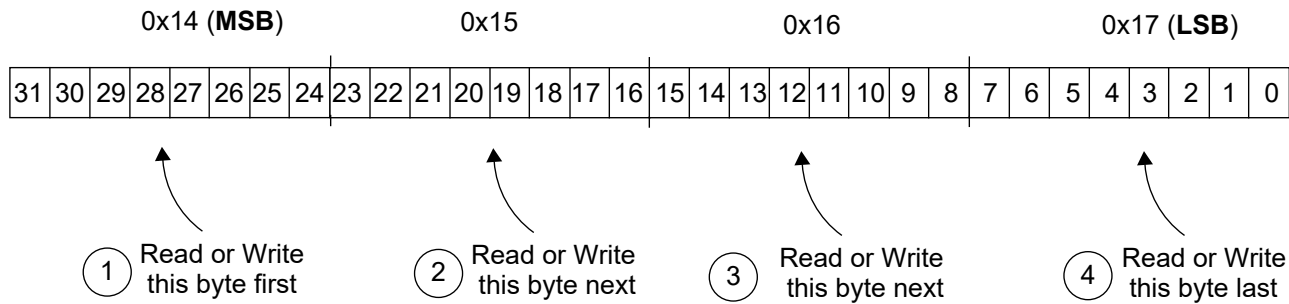

**The simplest way to generate appropriate configuration for the device is to use the evaluation board GUI which can operate standalone (without the board). With GUI user can quickly set all required parameters and save the configuration to a text file.**

### Multi-byte Register Values

The device register map is based on 8-bit register access, so register values that require more than 8 bits must be spread out over multiple registers and accessed in 8-bit segments. When accessing multi-byte register values, it is important that the registers are accessed in the proper order—they must follow big endian addressing scheme. The 8-bit register containing the most significant byte (MSB) must be accessed first, and the register containing the least significant byte (LSB) must be accessed last. An example of a multi-byte register is shown in Figure 21. When writing a multi-byte value, the value is latched when the LSB is written.

#### Example:

The programmable input reference M and N 16 bit values defining the M/N ratio is programmed using a 32-bit value which is spread over four 8-bit registers. The MSB is contained in address 0x14 and the LSB in 0x17. When reading or writing this multi-byte value, the MSB must be accessed first, followed by the middle bytes, and the LSB last.

**Figure 21 - Accessing Multi-byte Register Values**

To assist in device setup, a configuration GUI is provided. The configuration GUI can directly configure the device evaluation board, but it also functions as a tool to provide details on how to configure different device registers.

### Procedure for writing registers

For each of the following ZL30237 control registers, the user should implement the write procedure described below. Using this procedure to write other control registers is acceptable, but it is required for the registers listed below.

- Registers: 0x46, 0xB8 and, 0xBA

-write 0x01 to Sticky\_R\_Lock Register at address 0x0D  
 -write to one or more ZL30237 control register(s) listed above  
 -write 0x00 to Sticky\_R\_Lock Register at address 0x0D

### Time between two write accesses to the same register

- For each of the following four frequency adjustment registers, user should wait at least 0,1 ms between two

write accesses to the same register, and all of these four registers can be updated together every 0.1 ms.

"Synth0\_adjust\_en" at address 0xEC  
 "Synth0\_freq\_offset" at address 0xED: 0xF0  
 "Synth1\_adjust\_en" at address 0xF1  
 "Synth1\_freq\_offset" at address 0xF2: 0xF5

- For page\_register at address 0x7F and Sticky\_r\_lock register at address 0x0D, there is no waiting time required between two write accesses.
- For the other registers, user should wait at least 5 ms between two write accesses to the same register, and all of these registers can be updated together every 5 ms.

### Reading from Sticky Read (StickyR) registers

Access to some status registers is defined as Sticky Read (StickyR). Procedure for accessing these registers is:

- write 0x01 to StickyR Lock Register at address 0x0D
- clear status register(s) by writing 0x00 to it
- write 0x00 to StickyR Lock Register at address 0x0D
- wait for 8 ms
- read the status register(s)

The following table provides a summary of the registers available for status updates and configuration of the device. Devices with a custom OTP configuration will power-up with custom configuration values instead of the default values.

Reg_Addr (Hex)	Register Name	Default Value (Hex)	Description	Type
<b>Miscellaneous Registers</b>				
0x00	id_reg	See Description	Chip ID and version identification	R
<b>Output Synthesizer Configuration Registers</b>				
0x0D	Sticky_r_lock	0x00	Used to lock StickyR Status Registers from being updated by internal device logic	R/W
0x46	reduced_diff_out_pwr	0x00	Enables reduced power on high performance differential outputs	R/W
0x50:0x51	synth0_base_freq	0x9C40	Synthesizer 0 base frequency	R/W
0x52:0x53	synth0_freq_multiple	0x0798	Synthesizer 0 base frequency multiplication number	R/W
0x54:0x57	synth0_ratio_M_N	0x00010001	Specifies numerator Ms and denominator Ns for synthesizer 0 multiplication ratio Ms/Ns	R/W
0x58:0x59	synth1_base_freq	0x61A8	Synthesizer 1 base frequency	R/W

**Table 4 - Register Map**

Reg_Addr (Hex)	Register Name	Default Value (Hex)	Description	Type
0x5A:0x5B	synth1_freq_multiple	0x0C35	Synthesizer 1 base frequency multiplication number	R/W
0x5C:0x5F	synth1_ratio_M_N	0x00010001	Specifies numerator Ms and denominator Ns for synthesizer 1 multiplication ratio Ms/Ns	R/W
0x71	output_synthesizer_en	0x03	Output synthesizer enable	R/W
0x73:0x76	central_freq_offset	0x046AAAAB	Central frequency offset to compensate for oscillator inaccuracy	R/W
0x77	synth_1_0_filter_sel	0x00	Synthesizer 1 and 0 selection between internal and external filter	R/W
0x78	synth0_fine_phase_shift	0x00	Synthesizer 0 fine phase shift	R/W
0x79	synth1_fine_phase_shift	0x00	Synthesizer 1 fine phase shift	R/W
0x7F	page_register	0x00	Selects between pages 0 and 1	R/W
0x80:0x82	synth0_post_div_A	0x000002	Synthesizer 0 post divider A	R/W
0x83:0x85	synth0_post_div_B	0x000002	Synthesizer 0 post divider B	R/W
0x86:0x88	synth0_post_div_C	0x000040	Synthesizer 0 post divider C	R/W
0x89:0x8B	synth0_post_div_D	0x000040	Synthesizer 0 post divider D	R/W
0x8C,0x8E	synth1_post_div_A	0x000002	Synthesizer 1 post divider A	R/W
0x8F,0x91	synth1_post_div_B	0x000002	Synthesizer 1 post divider B	R/W
0x92,0x94	synth1_post_div_C	0x000032	Synthesizer 1 post divider C	R/W
0x95,0x97	synth1_post_div_D	0x000032	Synthesizer 1 post divider D	R/W
<b>Output Reference Selection and Output Driver Control</b>				
0xB0	hp_diff_en	0x00	High Performance differential output enable	R/W
0xB1	hp_cmos_en	0x00	Enables High Performance CMOS outputs hpoutclk[1:0]	R/W
0xB8	synth1_0_stop_clk	0x00	Stops output clocks for post dividers C and D of Synthesis Engine 0 and 1 at either high or low logical level	R/W
0xB9	sync_fail_flag_status	0x00	Indicates Synthesizers loss of lock	Sticky R
0xBA	clear_sync_fail_flag	0x00	Clears Synthesizers fail flag in register 0xB9	R/W

Table 4 - Register Map (continued)

Reg_Addr (Hex)	Register Name	Default Value (Hex)	Description	Type
0xBF:0xC0	phase_shift_s0_postdiv_C	0x0000	hpoutclk0 output coarse phase shift in granularity of 45 degrees and one high frequency synthesizer clock period.	R/W
0xC1:0xC2	phase_shift_s0_postdiv_D	0x0000	hpoutclk1 output coarse phase shift in granularity of 45 degrees and one high frequency synthesizer clock period.	R/W
0xC3	xo_or_crystal_sel	0x00	Disables OSCo driver.	R/W
0xC6	chip_revision	0x03	chip revision register	R/W
0xC7:0xC8	phase_shift_s1_postdiv_C	0x0000	hpoutclk2 output coarse phase shift in granularity of 45 degrees and one high frequency synthesizer clock period.	R/W
0xC9:0xCA	phase_shift_s1_postdiv_D	0x0000	hpoutclk3 output coarse phase shift in granularity of 45 degrees and one high frequency synthesizer clock period.	R/W

## 8.0 Detailed Register Map

Register_Address: <b>0x00</b> Register Name: <b>id_reg</b> Default Value: <b>See Description</b> Type: R/W		
Bit Field	Function Name	Description
4:0	chip_id	Chip Identification = 0b01010
6:5	chip_revision	Chip revision number = 0b00 (full chip revision = chip_revision bits in register 0xC6 and chip_revision bits[6:5] in register 0x00)
7	ready_indication	After reset this bit goes high when device is ready. This signals that user can start to program/configure the device. It can take up to 50 ms for this bit to go high after the reset. This bit should not be polled until 40ms after reset.

Register_Address: <b>0x0D</b> Register Name: <b>Sticky_r_lock</b> Default Value: <b>0x00</b> Type: R/W		
Bit Field	Function Name	Description
7:0	sticky_r_lock	This register is used when accessing StickyR status registers. Writing 0x01 to this register locks the status register from being updated by internal logic. Writing 0x00 to this register enables internal updates of StickyR status registers Please refer to <b>Reading from Sticky Read (StickyR) registers and Procedure to write registers</b> procedure in section 7.0, "Register Map"

Register\_Address: **0x46**  
 Register Name: **reduced\_diff\_out\_pw**  
 Default Value: **0x00**  
 Type: R/W

Bit Field	Function Name	Description
0	hpout0_reduced_pwr	When this bit is set to high, it will enable reduced power mode for HPDIFF0_P and HPDIFF0_N outputs. When low, the outputs are in full power mode.
1	hpout1_reduced_pwr	Same description as above but for HPDIFF1 output.
2	hpout2_reduced_pwr	Same description as above but for HPDIFF2 output.
3	hpout3_reduced_pwr	Same description as above but for HPDIFF3 output.
4	hpout4_reduced_pwr	Same description as above but for HPDIFF4 output.
5	hpout5_reduced_pwr	Same description as above but for HPDIFF5 output.
6	hpout6_reduced_pwr	Same description as above but for HPDIFF6 output.
7	hpout7_reduced_pwr	Same description as above but for HPDIFF7 output.

Register\_Address: **0x50:0x51**  
 Register Name: **synth0\_base\_freq**  
 Default Value: **0x9C40**  
 Type: **R/W**

Bit Field	Function Name	Description
15:0	synth0_base_freq_Bs	<p>Unsigned binary value of these bits represents Synthesizer0 base frequency Bs in Hz. Values for Br that can be programmed:</p> <p>0x03E8 for 1 kHz,            0x07D0 for 2 kHz,            0x1388 for 5 kHz,            0x186A for 6.25 kHz,            0x1F40 for 8 kHz,            0x2710 for 10 kHz,            0x30D4 for 12.5 kHz,            0x61A8 for 25 kHz,            0x9C40 for 40 kHz.</p> <p><b>Note:</b> Other Bs rates can be supported, please contact the CMPG application support team if another specific Bs rate is required</p>

Register\_Address: **0x52:0x53**  
 Register Name: **synth0\_freq\_multiple**  
 Default Value: **0x0798**  
 Type: **R/W**

Bit Field	Function Name	Description												
15:0	synth0_base_freq_mult_Ks	<p>Unsigned binary value of these bits represents Synthesizer0 base frequency multiplication number. For regular (non-FEC) synthesizer frequency, the 'Base frequency' number Bs multiplied by the 'Base frequency multiple' number Ks, and multiplied by 16 has to equal the synthesizer frequency in Hz.</p> <p><b>Note 1:</b> synthesizer frequency has to be between 1 GHz and 1.5 GHz, so:  <math>Bs \times Ks \times 16 \times Ms / Ns</math> has to be between 1 000 000 000 and 1 500 000 000.</p> <p>Examples of some synthesizer frequencies and appropriate values that can be programmed for Bs and Ks to get desired synthesizer frequency:</p> <table> <tr> <th>Synthesizer frequency</th><th>Base frequency Bs</th><th>Base frequency multiple Ks</th></tr> <tr> <td>1.048576 GHz</td><td>8 kHz (0x1F40)</td><td>8192 (0x2000)</td></tr> <tr> <td>1.24416 GHz</td><td>40 kHz (0x9C40)</td><td>1944 (0x0798)</td></tr> <tr> <td>1.25 GHz</td><td>25 kHz (0x61A8)</td><td>3125 (0x0C35)</td></tr> </table> <p><b>Note 2:</b> Synthesizer 0 and 1 can be set to generate identical frequencies if that frequency is between 1.1 GHz and 1.5 GHz. For frequencies between 1.0 GHz and 1.1 GHz Synthesizers 0 and 1 should not be set to generate the same frequency. In this case user should try to set one Synthesizer to lower range (1.0 GHz to 1.25 GHz) and the other to the higher range (1.25 GHz to 1.5 GHz) and then use different values for output dividers to get the same frequency at the output. This method can be used for all output frequencies except for output frequencies in 500 MHz to 550 MHz range. Please contact your local Field Applications Engineer for recommendations if output frequencies sourced from both high performance synthesizer need to be the same and in 500 MHz to 550 MHz range.</p>	Synthesizer frequency	Base frequency Bs	Base frequency multiple Ks	1.048576 GHz	8 kHz (0x1F40)	8192 (0x2000)	1.24416 GHz	40 kHz (0x9C40)	1944 (0x0798)	1.25 GHz	25 kHz (0x61A8)	3125 (0x0C35)
Synthesizer frequency	Base frequency Bs	Base frequency multiple Ks												
1.048576 GHz	8 kHz (0x1F40)	8192 (0x2000)												
1.24416 GHz	40 kHz (0x9C40)	1944 (0x0798)												
1.25 GHz	25 kHz (0x61A8)	3125 (0x0C35)												

Register\_Address: **0x54:0x57**  
 Register Name: **synth0\_ratio\_M\_N**  
 Default Value: **0x00010001**

Register\_Address: **0x58:0x59**  
 Register Name: **synth1\_base\_freq**  
 Default Value: **0x61A8**  
 Type: **R/W**

Bit Field	Function Name	Description
15:0	synth1_base_freq_Bs	<p>Unsigned binary value of these bits represents Synthesizer1 base frequency Bs in Hz. Values for Br that can be programmed:</p> <p>0x03E8 for 1 kHz,            0x07D0 for 2 kHz,            0x1388 for 5 kHz,            0x186A for 6.25 kHz,            0x1F40 for 8 kHz,            0x2710 for 10 kHz,            0x30D4 for 12.5 kHz,            0x61A8 for 25 kHz,            0x9C40 for 40 kHz.</p> <p><b>Note:</b> Other Bs rates can be supported, please contact the CMPG application support team if another specific Bs rate is required.</p>

Register\_Address: **0x5A:0x5B**  
 Register Name: **synth1\_freq\_multiple**  
 Default Value: **0x0C35**  
 Type: **R/W**

Bit Field	Function Name	Description												
15:0	synth1_base_freq_mult_Ks	<p>Unsigned binary value of these bits represents Synthesizer1 base frequency multiplication number. For regular (non-FEC) synthesizer frequency, the 'Base frequency' number Bs multiplied by the 'Base frequency multiple' number Ks, and multiplied by 8 has to equal the synthesizer frequency in Hz.</p> <p><b>Note 1:</b> : synthesizer frequency has to be programmed to be between 1 GHz and 1.5 GHz, so:  <math>Bs \times Ks \times 16 \times Ms / Ns</math> has to be between 1 000 000 000 and 1 500 000 000.</p> <p>Examples of some reference frequencies and appropriate values that can be programmed for Bs and Ks to get desired synthesizer frequency:</p> <table> <tr> <th>Synthesizer frequency</th><th>Base frequency Bs</th><th>Base frequency multiple Ks</th></tr> <tr> <td>1.048576 GHz</td><td>8 kHz (0x1F40)</td><td>8192 (0x2000)</td></tr> <tr> <td>1.24416 GHz</td><td>40 kHz (0x9C40)</td><td>1944 (0x0798)</td></tr> <tr> <td>1.25 GHz</td><td>25 kHz (0x61A8)</td><td>3125 (0x0C35)</td></tr> </table> <p><b>Note 2:</b> Synthesizer 0 and 1 can be set to generate identical frequencies if that frequency is between 1.1 GHz and 1.5 GHz. For frequencies between 1.0 GHz and 1.1 GHz Synthesizers 0 and 1 should not be set to generate the same frequency. In this case user should try to set one Synthesizer to lower range (1.0 GHz to 1.25 GHz) and the other to the higher range (1.25 GHz to 1.5 GHz) and then use different values for output dividers to get the same frequency at the output. This method can be used for all output frequencies except for output frequencies in 500 MHz to 550 MHz range. Please contact your local Field Applications Engineer for recommendations if output frequencies sourced from both high performance synthesizer need to be the same and in 500 MHz to 550 MHz range.</p>	Synthesizer frequency	Base frequency Bs	Base frequency multiple Ks	1.048576 GHz	8 kHz (0x1F40)	8192 (0x2000)	1.24416 GHz	40 kHz (0x9C40)	1944 (0x0798)	1.25 GHz	25 kHz (0x61A8)	3125 (0x0C35)

Register\_Address: **0x73:0x76**  
 Register Name: **central\_freq\_offset**  
 Default Value: **0x046AAAAB**  
 Type: **R/W**

Bit Field	Function Name	Description
31:0	central_freq_offset	<p>2's complement binary value of these bits represent central frequency offset for the device. This value should be used to compensate for oscillator inaccuracy, or make the device look like Numerically Controlled Oscillator (NCO). This register controls central frequency of all 4 Synthesizers.          Expressed in steps of <math>\pm 2^{-32}</math> of nominal setting.</p> <p>When oscillator inaccuracy is known: <math>\text{inacc\_osc} = (f_{\text{osc}} - f_{\text{nom}})/f_{\text{nom}}</math> (usually specified in ppm), value to be programmed in this register is calculated as per the following formula:</p> <p><math>X = (1/(1 + \text{inacc\_osc}) - 1) \cdot 2^{32}</math>, when <math>f_{\text{osc}} &lt; f_{\text{nom}}</math>  <math>X = (1/(1 - \text{inacc\_osc}) - 1) \cdot 2^{32}</math>, when <math>f_{\text{osc}} &gt; f_{\text{nom}}</math>,          where <math>\text{inacc\_osc}</math> - represents oscillator frequency inaccuracy,  <math>f_{\text{osc}}</math> - represents oscillator frequency, and  <math>f_{\text{nom}}</math> - represents oscillator nominal frequency (i.e., 25 MHz)</p> <p>Generally, when the oscillator frequency is lower than the nominal, frequency offset has to be programmed to compensate it in opposite direction, i.e. frequency offset has to be positive, and vice versa.</p> <p>Example 1): if oscillator inaccuracy is -2% (<math>f_{\text{osc}} = 24.5</math> MHz; <math>\text{inacc\_osc} = (f_{\text{osc}} - 25 \text{ MHz})/25 \text{ MHz} = -0.02</math>),  <math>X = (1/(1 + (-0.02)) - 1) \cdot 2^{32} = (1/0.98 - 1) \cdot 2^{32} = 87652394 = 0x0539782A</math></p> <p>Example 2): if oscillator inaccuracy is +2% (<math>f_{\text{osc}} = 25.5</math> MHz; <math>\text{inacc\_osc} = (f_{\text{osc}} - 25 \text{ MHz})/25 \text{ MHz} = 0.02</math>),  <math>X = (1/(1 - 0.02)) \cdot 2^{32} = (1/0.98) \cdot 2^{32} = 4210752251 = 0xFAFAFAFB</math></p> <p>When NCO behavior is desired, the output frequency should be calculated as per formula:  <math>f_{\text{out}} = (1 + X/2^{32}) \cdot f_{\text{init}}</math>          where <math>X</math> -represent 2's complement number specified in this register  <math>f_{\text{init}}</math> - initial frequency set by Bs, Ks, Ms, Ns and postdivider number for particular VCO  <math>f_{\text{out}}</math> - output frequency</p> <p><b>Note 1:</b> Nominal frequency for central frequency offset calculation is 25 MHz although master clock frequency is required to be 24.576 MHz. Because of this default value in this register is 0x046AAAAB.  <b>Note 2:</b> Central Frequency Offset should not exceed <math>\pm 5\%</math> off nominal.</p>

Register\_Address: **0x77**

18	frm_pulse_polar_or_div	<p>When bits 23:20 of this register are programmed to '1111', this bit represents frame pulse polarity:            0: regular (non-inverse) polarity            1: inverse polarity</p> <p>When bits 23:20 of this register are programmed to any other value, the appropriate output clock is selected to have a 'normal' 50% duty cycle clock, and binary value of this bit combined with other bits of this register creates postdivider ratio for the output clock.</p>
19	frm_pulse_type_or_div	<p>When bits 23:20 of this register are programmed to '1111', this bit represents frame pulse type:            0: ST-BUS type frame pulse (frame boundary straddles in the middle of the frame pulse)            1: GCI Bus type frame pulse (frame boundary defined by the edge of the frame pulse)</p> <p>When bits 23:20 of this register are programmed to any other value, the appropriate output clock is selected to have a 'normal' 50% duty cycle clock, and binary value of this bit combined with other bits of this register creates postdivider ratio for the output clock</p>
23:20	frm_pulse_or_div	<p>When these bits are programmed to '1111', the appropriate output clock is selected to have a 'frame pulse' shape. Details about the frame pulse type, polarity and frequency are specified in bits 19:0 of this register.</p> <p>When these bits are programmed to any other value, the appropriate output clock is selected to have a 'normal' 50% duty cycle clock, and binary value of these bits combined with bits 19:0 of this register creates postdivider ratio for the output clock (i.e. division ratio between appropriate VCO frequency and the desired output clock frequency)</p> <p><b>Note:</b> Maximum division ratio for 'normal' clock is 0xEFFFFF = 15728639.</p>

Register\_Address: **0x95:0x97**  
 Register Name: **synth1\_post\_div\_D**  
 Default Value: **0x000032**  
 Type: **R/W**

Bit Field	Function Name	Description
15:0	frm_pulse_period_or_div	<p>When bits 23:20 of this register are programmed to '1111', binary value of these bits represent number of periods of the selected related clock in between two frame pulses</p> <p>When bits 23:20 of this register are programmed to any other value, the appropriate output clock is selected to have a 'normal' 50% duty cycle clock, and binary value of these bits combined with other bits of this register creates postdivider ratio for the output clock (Synthesizer1 Post Divider value P1D). The Synthesizer1 VCO frequency is divided by the P1D value to get desired output clock frequency on selected output pins.</p> <p><b>Note:</b> The output clock duty-cycle may not be within specified 45% to 55% when post divider value P1D is an odd number and where frequency of the output clock is close to the maximum output frequency supported by hpoutclk. The worst case duty-cycle is 30% is when synthesizer frequency is set to 1 GHz and the P1D is set to 7. If duty-cycle of 45% to 55% is required, user can set synthesizer to run at 1GHz * 8/7 and P1D to 8 which will still generate the same frequency but within 45% to 55% duty-cycle.          For odd P1D values greater than or equal to 41 ( 43, 45 ...) the duty-cycle will be within 45% to 55%.          For even P1D values duty-cycle is always within 45% to 55%.</p>
17:16	frm_pulse_clk_sel_or_div	<p>When bits 23:20 of this register are programmed to '1111', these bits select related clock (postdivider) within the same synthesizer 1 (frame pulse width is equal to the related clock period):          00: clock 0 (Synth 1 postdivider A)          01: clock 1 (Synth 1 postdivider B)          10: clock 2 (Synth 1 postdivider C)          11: reserved</p> <p>When bits 23:20 of this register are programmed to any other value, the appropriate output clock is selected to have a 'normal' 50% duty cycle clock, and binary value of these bits combined with other bits of this register creates postdivider ratio for the output clock.</p> <p><b>Note:</b> It is forbidden for frame pulse to select 'itself' as its related clock</p>

4	Voltage on osci and osco pin	$V_{OSC}$	-0.3	$V_{DD} + 0.3$	V
5	Storage temperature	$T_{ST}$	-55	125	°C

\* Exceeding these values may cause permanent damage. Functional operation under these conditions is not implied.

\* Voltages are with respect to ground (GND) unless otherwise stated

### Recommended Operating Conditions\*

	Characteristics	Sym.	Min.	Typ.	Max.	Units
1	Supply voltage	$V_{DD-IO}$ $AV_{DD}$	3.135	3.30	3.465	V
2	Core supply voltage	$V_{CORE}$	1.71	1.80	1.89	V
3	Operating temperature	$T_A$	-40	25	85	°C
4	Input voltage	$V_{DD-IO}$	2.97	3.30	3.63	V

\* Voltages are with respect to ground (GND) unless otherwise stated

### DC Electrical Characteristics - Power - Core

	Characteristics	Sym.	Typ.	Max.	Units	Notes
1	Core supply current (Vcore)	$I_{CORE}$ (Vdd 3.3V)	46	48	mA	
		$I_{CORE}$ (Vdd 1.8V)	102	109	mA	
2	Current for each HP Synthesis Engine	$I_{SYN}$ (Vdd 3.3V)	57	73	mA	
		$I_{SYN}$ (Vdd 1.8V)	0.2	1	mA	

### DC Electrical Characteristics - Power - High Performance Outputs

	Characteristics	Sym.	Typ.	Max.	Units	Notes
1	Power for each hpdiff clock driver	$P_{hpdiff}$ (Vdd 3.3V)	85	91	mW	Including power to biasing and load resistors $R_L = 50\Omega$
2	Power for each hpdiff clock driver minus power dissipated in the biasing and load resistors.	$P_{hpdiff}$ (Vdd 3.3V)	36	42	mW	Without power to biasing and load resistors $R_L = 50\Omega$

**DC Electrical Characteristics - Power - High Performance Outputs**

	Characteristics	Sym.	Typ.	Max.	Units	Notes
3	Power for each hpdiff clock driver (reduced power mode)	$P_{\text{hpdiffp}}(\text{Vdd } 3.3\text{V})$	80	86	mW	Including power to biasing and load resistors $R_L = 50\Omega$
4	Power for each hpdiff clock driver minus power dissipated in the load resistor. (reduced power mode)	$P_{\text{hpdiffp}}(\text{Vdd } 3.3\text{V})$	31	37	mW	Without power to biasing and load resistors $R_L = 50\Omega$
5	Power for each output divider of high performance synthesizers (enabled if one of two differential outputs assigned to it is enabled).	$P_{\text{div}}(\text{Vdd } 3.3\text{V})$	17	40	mW	
6	Power for each hpoutclk clock driver	$P_{\text{hpout}}(\text{Vdd } 3.3\text{V})$	17+ 7	40+36	mW	155.52 MHz output 10 pF load fixed power (due to output divider) + variable power (proportional to frequency and load)

\* Supply voltage and operating temperature are as per Recommended Operating Conditions.

\* Voltages are with respect to ground (GND) unless otherwise state.

**DC Electrical Characteristics - Inputs**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	CMOS high-level input voltage	$V_{\text{CIH}}$	$0.7 \cdot V_{\text{DD}} - I_O$			V	
2	CMOS low-level input voltage	$V_{\text{CIL}}$			$0.3 \cdot V_{\text{DD}} - I_O$	V	
3	CMOS Input leakage current	$I_{\text{IL}}$	-10		10	$\mu\text{A}$	$V_I = V_{\text{DD}}$ or 0 V

**AC/DC Electrical Characteristics - OSCi Input**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	CMOS high-level input voltage	$V_{\text{CIH}}$	2.0			V	
2	CMOS low-level input voltage	$V_{\text{CIL}}$			0.8	V	
3	Input leakage current	$I_{\text{IL}}$	-10		10	$\mu\text{A}$	$V_I = V_{\text{DD}}$ or 0 V
4	Duty Cycle		40		60	%	

**DC Electrical Characteristics - High Performance Outputs**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	HPCMOS High-level output voltage	$V_{OH}$	$0.8AV_{DD}$			V	$I_{OH} = 2mA$ $C_L = 5pF$
2	HPCMOS Low-level output voltage	$V_{OL}$			$0.2AV_{DD}$	V	$I_{OL} = 2mA$ $C_L = 5pF$
3	LVPECL: High-level output voltage	$V_{OH\_LV}$ PECL	$AV_{DD}$ - 1.12	$AV_{DD}$ - 1.00	$AV_{DD}$ - 0.88	V	$R_L = 50\Omega$ to $AV_{DD} - 2V$ , $C_L = 1pF$
4	LVPECL: Low-level output voltage	$V_{OL\_LVP}$ ECL	$AV_{DD}$ - 1.81	$AV_{DD}$ - 1.71	$AV_{DD}$ - 1.55	V	$R_L = 50\Omega$ to $AV_{DD} - 2V$ , $C_L = 1pF$
5	LVPECL: Differential output voltage*	$V_{OD\_LV}$ PECL	0.53	0.67	0.80	V	$R_L = 50\Omega$ to $AV_{DD} - 2V$ , $C_L = 1pF$

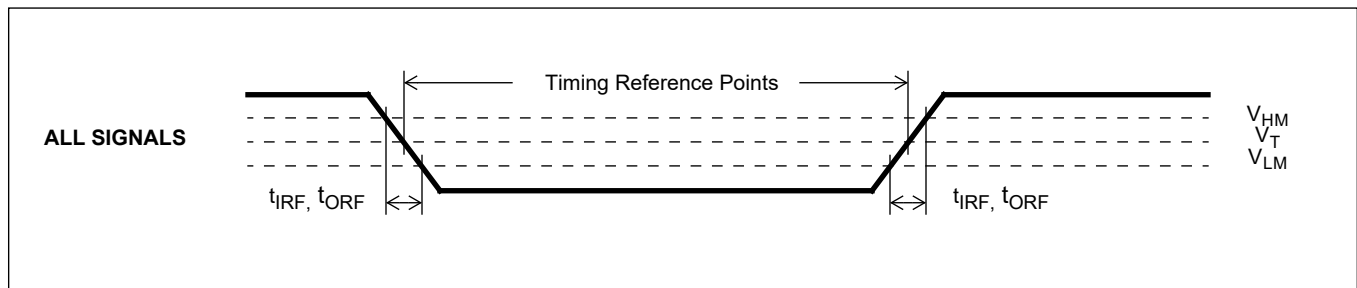

\* Output swing is guaranteed for frequency up to 720MHz, it may decrease by 50mv if the frequency is greater than 720 MHz

**AC Electrical Characteristics\* - Output Timing Parameters Measurement Voltage Levels (see Figure 22)**

	Characteristics	Sym.	CMOS	LVPECL	Units
1	Threshold Voltage	$V_{T-CMOS}$ $V_{T-LVPECL}$ $V_{T-CML}$	$0.5V_{DD}$	$0.5V_{OD\_LVPECL}$	V
2	Rise and Fall Threshold Voltage High	$V_{HM}$	$0.7V_{DD}$	$0.8V_{OD\_LVPECL}$	V
3	Rise and Fall Threshold Voltage Low	$V_{LM}$	$0.3V_{DD}$	$0.2V_{OD\_LVPECL}$	V

\* Supply voltage and operating temperature are as per Recommended Operating Conditions

\* Voltages are with respect to ground (GND) unless otherwise stated

**Figure 22 - Timing Parameter Measurement Voltage Levels**

**AC Electrical Characteristics\* - Outputs (see Figure 23).**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	Clock skew between outputs	$t_{OUT2OUTD}$	-1	0	+1	ns	
3	Output clock Duty Cycle	$t_{PWH}, t_{PWL}$	45%	50%	55%	Duty Cycle	
4	hpdiff (LVPECL) Output clock rise or fall time	$t_r / t_f$	265	370	515	ps	
5	hpoutclk (LVCMOS) clock rise and fall time	$t_r / t_f$	620	950	1490	ps	10pF load
6	Output Clock Frequency (hpdiff)	$F_{hpdiff}$			750	MHz	
7	Output Clock Frequency (hpoutclk)	$F_{hpout}$			177.5	MHz	

\* Supply voltage and operating temperature are as per Recommended Operating Conditions

**Figure 23 - Output Timing Referenced To hpclkout0/clkout0**

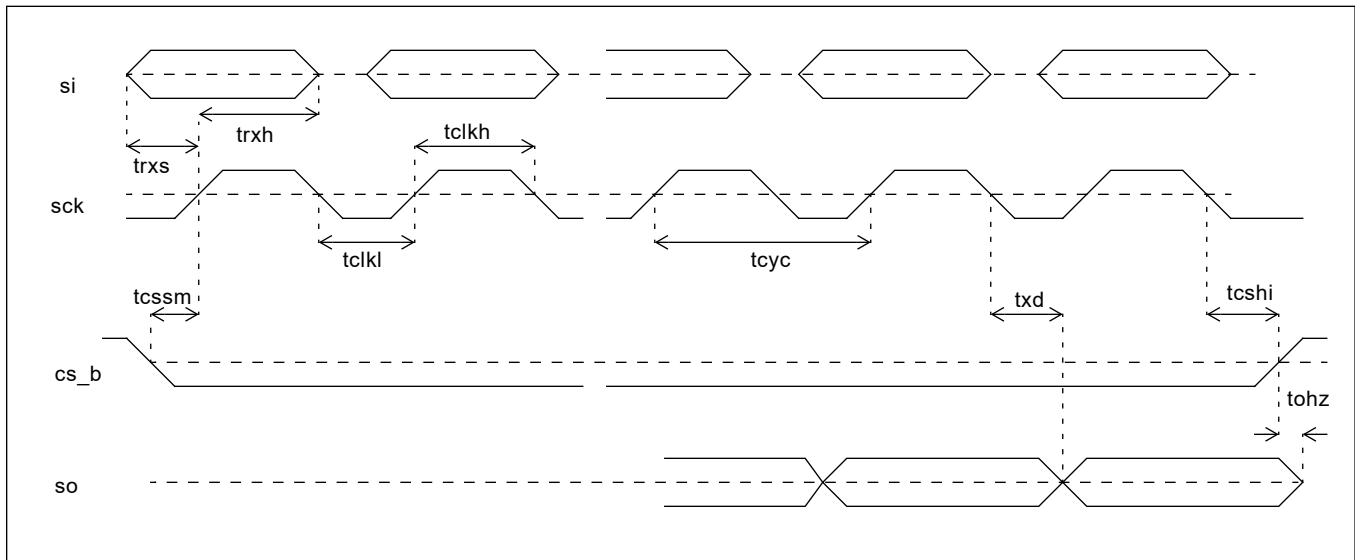

Functional waveforms and timing characteristics for the LSB first mode are shown in Figure 24, and Figure 25 describe the MSB first mode. Table 5 shows the timing specifications.

Specification	Name	Min.	Max.	Units
sck period	tcyc	124		ns
sck pulse width low	tclkl	62		ns
sck pulse width high	tclkh	62		ns
si setup (write) from sck rising	trxs	10		ns
si hold (write) from sck rising	trxh	10		ns
so delay (read) from sck falling	txd		25	ns
cs_b setup from sck falling (LSB first)	tcssi	20		ns
cs_b setup from sck rising (MSB first)	tcssm	20		ns
cs_b hold from sck falling (MSB first)	tcshm	10		ns
cs_b hold from sck rising (LSB first)	tcshi	10		ns
cs_b to output high impedance	tohz		60	ns

**Table 5 - Serial Peripheral Interface Timing**

**Figure 24 - Serial Peripheral Interface Timing - LSB First Mode**

**Figure 25 - Serial Peripheral Interface Timing - MSB First Mode**

The timing specification for the I<sup>2</sup>C interface is shown in Figure 26 and Table 6.

Specification	Name	Min.	Typ.	Max.	Units	Note
SCL clock frequency	$f_{SCL}$	0		400	kHz	
Hold time START condition	$t_{HD:STA}$	0.6			us	
Low period SCL	$t_{LOW}$	1.3			us	
Hi period SCL	$t_{HIGH}$	0.6			us	
Setup time START condition	$t_{SU:STA}$	0.6			us	
Data hold time	$t_{HD:DAT}$	0		0.9	us	
Data setup time	$t_{SU:DAT}$	100			ns	
Rise time	$t_r$				ns	Determined by choice of pull-up resistor
Fall time	$t_f$	20 + $0.1C_b$		250	ns	
Setup time STOP condition	$t_{SU:STO}$	0.6			us	
Bus free time between STOP/START	$t_{BUF}$	1.3			us	
Pulse width of spikes which must be suppressed by the input filter	$t_{SP}$	0		50	ns	
Max capacitance for each I/O pin				10	pF	

Table 6 - I<sup>2</sup>C Serial Microport Timing

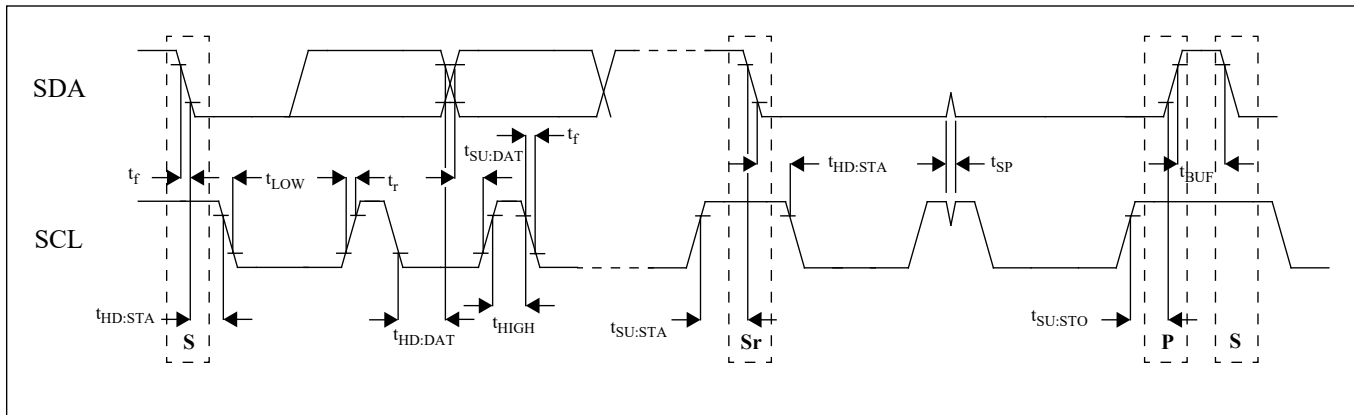

Figure 26 - I<sup>2</sup>C Serial Microport Timing

## 10.0 Performance Characterization

### 10.1 Output Clocks RMS Jitter Generation

Output Frequency	Jitter Measurement Filter	Max	Units	Notes
622.08 MHz	50 kHz - 80 MHz	0.63	ps <sub>rms</sub>	
	12 kHz - 20 MHz	0.76	ps <sub>rms</sub>	

Table 7 - Jitter Generation Specifications - HPDIFF Outputs

Output Frequency	Jitter Measurement Filter	Max	Units	Notes
25 MHz	12 kHz - 5 MHz	0.99	ps <sub>rms</sub>	
77.76 MHz	12 kHz - 20 MHz	1.03	ps <sub>rms</sub>	
125 MHz	12 kHz - 20 MHz	0.86	ps <sub>rms</sub>	
156.25 MHz	12 kHz - 20 MHz	0.93	ps <sub>rms</sub>	

Table 8 - Jitter Generation Specifications - HPOUT Outputs

### 10.2 Output Clocks Cycle-to-Cycle Jitter Generation

Output Frequency	Max	Units	Notes
125 MHz	29.2	ps <sub>PK-PK</sub>	
156.25 MHz	28.2	ps <sub>PK-PK</sub>	
212.5 MHz	27.9	ps <sub>PK-PK</sub>	

Table 9 - Jitter Generation Specifications - HPDIFF Outputs

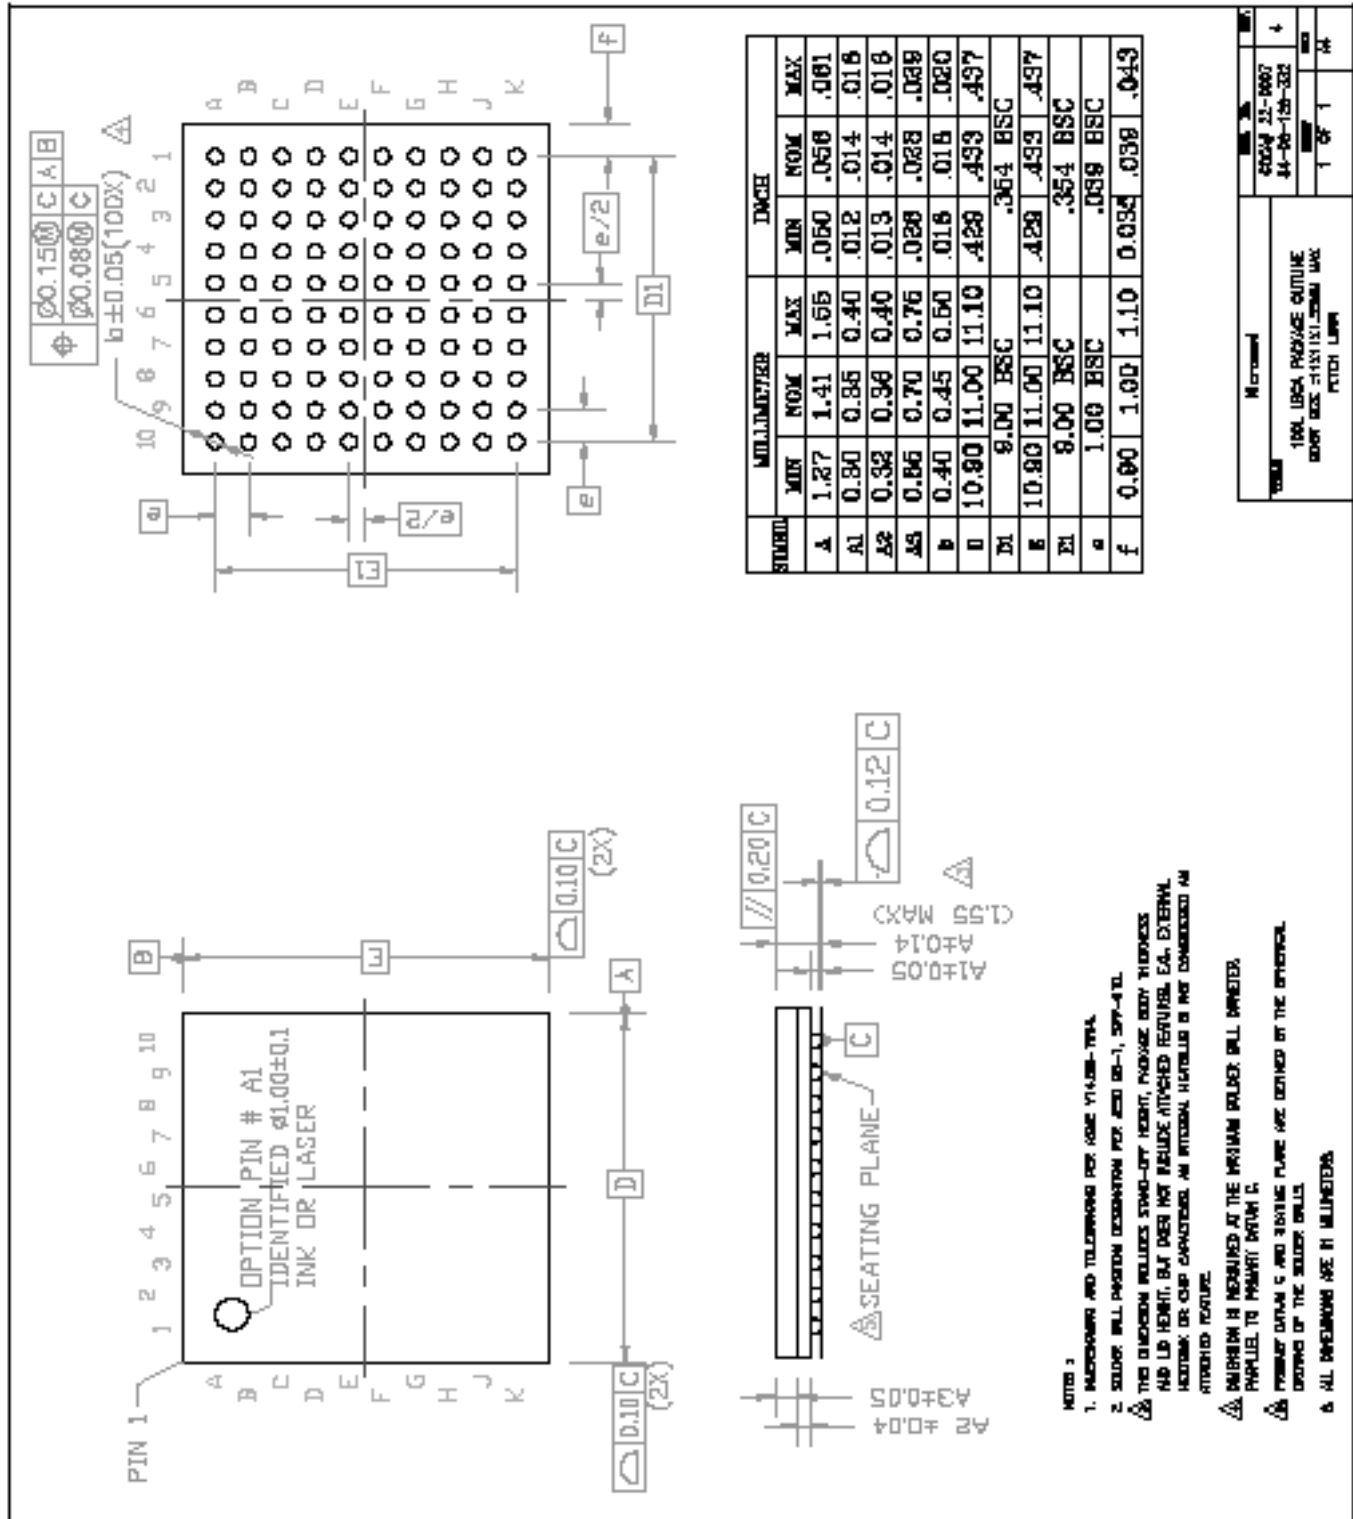

## 11.0 Thermal Characteristics

Parameter	Symbol	Test Condition	Value	Unit
Junction to Ambient Thermal Resistance	$\theta_{ja}$	Still Air 1 m/s 2 m/s	29.7 26.5 25.3	$^{\circ}\text{C}/\text{W}$
Junction to Case Thermal Resistance	$\theta_{jc}$		7.7	$^{\circ}\text{C}/\text{W}$
Maximum Junction Temperature *	$T_{jmax}$		125	$^{\circ}\text{C}$
Maximum Ambient Temperature	$T_A$		85	$^{\circ}\text{C}$

\* Proper thermal management must be practiced to ensure that  $T_{jmax}$  is not exceeded

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for communications, defense & security, aerospace and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; security technologies and scalable anti-tamper products; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif., and has approximately 3,400 employees globally. Learn more at [www.microsemi.com](http://www.microsemi.com).

Microsemi makes no warranty, representation, or guarantee regarding the information contained herein or the suitability of its products and services for any particular purpose, nor does Microsemi assume any liability whatsoever arising out of the application or use of any product or circuit. The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same. The information provided by Microsemi hereunder is provided "as is, where is" and with all faults, and the entire risk associated with such information is entirely with the Buyer. Microsemi does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other IP rights, whether with regard to such information itself or anything described by such information. Information provided in this document is proprietary to Microsemi, and Microsemi reserves the right to make any changes to the information in this document or to any products and services at any time without notice.
