Pin Function

INC: Increment Control Input

The \overline{INC} input moves the wiper in the up or down direction determined by the condition of the U/\overline{D} input.

U/D: Up/Down Control Input

The U/\overline{D} input controls the direction of the wiper movement. When in a high state and \overline{CS} is low, any high-to-low transition on \overline{INC} will cause the wiper to move one increment toward the R_H terminal. When in a low state and \overline{CS} is low, any high-to-low transition on \overline{INC} will cause the wiper to move one increment towards the R_L terminal.

R_H: High End Potentiometer Terminal

 $R_{\rm H}$ is the high end terminal of the potentiometer. It is not required that this terminal be connected to a potential greater than the $R_{\rm L}$ terminal. Voltage applied to the $R_{\rm H}$ terminal cannot exceed the supply voltage, $V_{\rm CC}$ or go below ground, GND.

Rw: Wiper Potentiometer Terminal

 R_W is the wiper terminal of the potentiometer. Its position on the resistor array is controlled by the control inputs, \overline{INC} , U/\overline{D} and \overline{CS} . Voltage applied to the R_W terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND.

R_L: Low End Potentiometer Terminal

 $R_{\rm L}$ is the low end terminal of the potentiometer. It is not required that this terminal be connected to a potential less

than the R_H terminal. Voltage applied to the R_L terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND. R_L and R_H are electrically interchangeable.

CS: Chip Select

The chip select input is used to activate the control input of the CAT5114 and is active low. When in a high state, activity on the $\overline{\rm INC}$ and ${\rm U/\overline{D}}$ inputs will not affect or change the position of the wiper.

Device Operation

The CAT5114 operates like a digitally controlled potentiometer with R_H and R_L equivalent to the high and low terminals and R_W equivalent to the mechanical potentiometer's wiper. There are 32 available tap positions including the resistor end points, R_H and R_L . There are 31 resistor elements connected in series between the R_H and R_L terminals. The wiper terminal is connected to one of the 32 taps and controlled by three inputs, \overline{INC} , U/\overline{D} and \overline{CS} . These inputs control a seven—bit up/down counter whose output is decoded to select the wiper position. The selected wiper position can be stored in nonvolatile memory using the \overline{INC} and \overline{CS} inputs.

With $\overline{\text{CS}}$ set LOW the CAT5114 is selected and will respond to the U/ $\overline{\text{D}}$ and $\overline{\text{INC}}$ inputs. HIGH to LOW transitions on $\overline{\text{INC}}$ will increment or decrement the wiper (depending on the state of the U/ $\overline{\text{D}}$ input and seven-bit counter). The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. The value of the counter is stored in nonvolatile memory whenever $\overline{\text{CS}}$ transitions HIGH while the $\overline{\text{INC}}$ input is also HIGH. When the CAT5114 is powered-down, the last stored wiper counter position is maintained in the nonvolatile memory. When power is restored, the contents of the memory are recalled and the counter is set to the value stored.

With $\overline{\text{INC}}$ set low, the CAT5114 may be de–selected and powered down without storing the current wiper position in nonvolatile memory. This allows the system to always power up to a preset value stored in nonvolatile memory.
