

# LTC2873

## ABSOLUTE MAXIMUM RATINGS

(Notes 1 and 2)

Input Supplies

$V_{CC}, V_L$  ..... -0.3V to 7V

Generated Supplies

$V_{DD}$  .....  $V_{CC} - 0.3V$  to 7.5V

$V_{EE}$  ..... -7.5V to 0.3V

SW ..... -0.3V to ( $V_{DD} + 0.3V$ )

CAP ..... ( $V_{EE} - 0.3V$ ) to 0.3V

A/DO, B/RI ..... -15V to 15V

DI, 485/232, DE485/F232, RE485,

TE485, LB ..... -0.3V to 7V

SHDN, RO ..... -0.3V to ( $V_L + 0.3V$ )

Differential Terminator Voltage (Enabled)

(A/DO to B/RI) .....  $\pm 6V$

Differential Terminator Voltage (Disabled)

(A/DO to B/RI) .....  $\pm 30V$

Operating Temperature

LTC2873C ..... 0°C to 70°C

LTC2873I ..... -40°C to 85°C

LTC2873H ..... -40°C to 125°C

Storage Temperature Range ..... -65°C to 150°C

## PIN CONFIGURATION

## ORDER INFORMATION

<http://www.linear.com/product/LTC2873#orderinfo>

LEAD FREE FINISH	TAPE AND REEL	PART MARKING	PACKAGE DESCRIPTION	TEMPERATURE RANGE
LTC2873CUFD#PBF	LTC2873CUFD#TRPBF	2873	24-Lead (4mm × 5mm) Plastic QFN	0°C to 70°C
LTC2873IUFD#PBF	LTC2873IUFD#TRPBF	2873	24-Lead (4mm × 5mm) Plastic QFN	-40°C to 85°C
LTC2873HUFD#PBF	LTC2873HUFD#TRPBF	2873	24-Lead (4mm × 5mm) Plastic QFN	-40°C to 125°C

Consult LTC Marketing for parts specified with wider operating temperature ranges.

For more information on lead free part marking, go to: <http://www.linear.com/leadfree/>

For more information on tape and reel specifications, go to: <http://www.linear.com/tapeandree/>. Some packages are available in 500 unit reels through designated sales channels with #TRMPBF suffix.

**ELECTRICAL CHARACTERISTICS** The ● denotes the specifications which apply over the full operating temperature range, otherwise specifications are at  $T_A = 25^\circ\text{C}$ .  $V_{CC} = V_L = 3.3\text{V}$ ,  $\overline{\text{TE485}} = V_L$ ,  $\text{LB} = 0\text{V}$  unless otherwise noted. (Notes 2, 6)

SYMBOL	PARAMETER	CONDITIONS		MIN	TYP	MAX	UNITS

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** All currents into device pins are positive; all currents out of device pins are negative. All voltages are referenced to device ground unless otherwise specified.

**Note 3:** Guaranteed by other measured parameters and not tested directly.

**Note 4:** Time from  $\text{SHDN} \uparrow$  until  $V_{DD} \geq 5\text{V}$  and  $V_{EE} \leq -5\text{V}$ . External components as shown in the Typical Application section.

**Note 5:** Guaranteed by design and not subject to production test.

**Note 6:** Testing was done with  $V_{DD}$  and  $V_{EE}$  back driven to valid supply levels for functions that require these supplies, unless otherwise noted.

**Note 7:** If enabling from shutdown, where  $V_{DD}$  and  $V_{EE}$  supplies are collapsed, allow the extra time it takes to generate valid  $V_{DD}$  and  $V_{EE}$  supplies ( $t_{\text{RDY}}$ ).

## PIN FUNCTIONS

**V<sub>EE</sub> (Pins 1, 10, 25):** Generated Negative Supply Voltage for RS232 Driver (–6.3V). Tie all pins together and connect 1μF capacitor between V<sub>EE</sub> (Pin 10) and GND. Exposed pad (Pin 25) must be soldered to PCB to maintain low thermal resistance.

**RO (Pin 2):** RS485 Differential Receiver Output and RS232 Receiver Output. Logic level referenced to GND and V<sub>L</sub>.

**485/232 (Pin 3):** Interface Select Input. A logic low enables RS232 mode and a high enables RS485 mode. The mode determines which transceiver inputs and outputs are accessible at the LTC2873 pins. Logic level referenced to GND and V<sub>L</sub>. Do not float.

**RE485 (Pin 4):** RS485 Receiver Enable. In RS485 mode, a logic high disables the RS485 receiver, leaving its output Hi-Z and a logic low enables the RS485 receiver. This input has no function in RS232 mode (485/232 low). Logic level referenced to GND and V<sub>L</sub>. Do not float.

**DE485/F232 (Pin 5):** RS485 Driver Enable and RS232 Fast Mode Enable. In RS485 mode (485/232 high), a logic low disables the RS485 driver leaving the driver outputs in a Hi-Z state and a logic high enables the RS485 driver. In RS232 mode (485/232 low), a logic high enables Fast mode with maximum data rate of 1Mbps. A logic low enables Slow mode with a maximum data rate of 250kbps. Logic level referenced to GND and V<sub>L</sub>. Do not float.

**DI (Pin 6):** RS485 and RS232 Driver Input. Logic level referenced to GND and V<sub>L</sub>. Do not float.

**SHDN (Pin 7):** Shutdown Control. A logic low disables the LTC2873 into low power shutdown state, independent of the other inputs. Driver and receiver outputs become Hi-Z. Logic level referenced to GND and V<sub>L</sub>. Do not float.

**GND (Pin 8, 11, 16, 20):** Ground. Tie all four pins together.

**CAP (Pin 9):** Charge Pump Capacitor for Generated Negative Supply Voltage V<sub>EE</sub>. Connect a 220nF capacitor between CAP and SW.

**SW (Pin 12):** Switch Pin. Connect 10μH inductor between SW and V<sub>CC</sub>. See Inductor Selection section for further details.

**V<sub>DD</sub> (Pin 13):** Generated Positive Supply Voltage for RS232 Driver (+7.0V). Connect 1μF capacitor between V<sub>DD</sub> and GND.

**V<sub>CC</sub> (Pin 14, 18, 21):** Input Supply (3V to 5.5V). Tie all three pins together and connect a 2.2μF or larger capacitor between V<sub>CC</sub> (adjacent to V<sub>DD</sub>) and GND.

**B/RI (Pin 15):** RS485 Negative Receiver Input and Driver Output. In RS232 mode, this is the RS232 receiver input.

**A/DO (Pin 17):** RS485 Positive Receiver Input and Driver Output. In RS232 mode, this is the RS232 driver output.

**NC (Pin 19):** Not connected internally.

**V<sub>L</sub> (Pin 22):** Logic Supply (1.7V to 5.5V) for the Receiver Outputs, Driver Inputs, and Control Inputs. Bypass this pin to GND with a 0.1μF capacitor if not tied to V<sub>CC</sub>. Keep V<sub>L</sub> ≤ V<sub>CC</sub> for operation guaranteed to meet specifications. However, V<sub>L</sub> > V<sub>CC</sub> will not damage the device, provided that absolute maximum limits are respected. See “V<sub>L</sub> Logic Supply and Logic Pins” in Applications section for more information.

**LB (Pin 23):** Loopback Enable. A logic high enables logic loopback diagnostic mode, internally routing the driver input logic signals to the receiver output pins. This applies to RS232 and RS485 operation. The targeted receiver must be enabled for the loopback signal to be available on its output. A logic low disables Loopback mode. In Loopback mode, signals are not inverted from driver inputs to receiver outputs. Logic level referenced to GND and V<sub>L</sub>. Do not float.

**TE485 (Pin 24):** RS485 Termination Enable. In RS485 mode, a logic low enables a 120Ω resistor between pins A/DO and B/RI. A logic high opens the resistor between A/DO and B/RI, leaving the pins unterminated. In RS485 mode, the 5k resistor between B/RI and GND is never engaged. In RS232 mode, the 120Ω resistor between A/DO and B/RI is never engaged, regardless of the state of TE485, and the 5k resistor between B/RI and GND is always engaged. Logic level referenced to GND and V<sub>L</sub>. Do not float.

## APPLICATIONS INFORMATION

The LTC2873 is a flexible multiprotocol transceiver supporting RS485/RS422 and RS232 protocols.

This device can be powered from a single 3V to 5.5V supply with optional logic interface supply as low as 1.7V. An integrated DC/DC converter provides the positive and negative supply rails needed for RS232 operation. Automatically selected integrated termination resistors for both RS232 and RS485 protocols are included, eliminating the need for external termination components and switching relays. A logic loopback control is included for self-test and debug.

The LTC2873 bus interface is a single two-pin port that can be configured as either an RS232 driver/receiver pair or a differential RS485 (and RS422) transceiver depending on the state of the 485/232 pin. In RS485 mode, the driver and receiver can be enabled independently with the DE485/F232 and RE485 pins, or by tying these signals together, a single control selects transmit or receive modes. A 120 $\Omega$  termination resistor is automatically engaged between pins A/D0 and B/R1 in RS485 mode if TE485 is low.

When the LTC2873 is in RS232 mode, the RS232 driver and receivers are both active and a 5k resistor is engaged at the receiver input to ground. The slew rate in RS232 mode can be set to support 1Mbps or 250kbps operation using the DE485/F232 pin.

The LTC2873 features rugged operation with ESD ratings of  $\pm 26\text{kV}$  HBM on the RS232 and RS485 receiver inputs and driver outputs, both unpowered and powered. All other pins offer protection exceeding  $\pm 4\text{kV}$ .

### DC/DC Converter

The on-chip DC/DC converter operates from the  $V_{CC}$  input, generating a 7.0V  $V_{DD}$  supply and a charge pumped  $-6.3\text{V}$   $V_{EE}$  supply, as shown in Figure 16.  $V_{DD}$  and  $V_{EE}$  power the output stage of the RS232 drivers and are regulated to levels that guarantee greater than  $\pm 5\text{V}$  output swing.

The DC/DC converter requires a 10 $\mu\text{H}$  inductor (L1) and a bypass capacitor (C4) of 2.2 $\mu\text{F}$ . The charge pump capacitor (C1) is 220nF and the storage capacitors (C2 and C3) are 1 $\mu\text{F}$ . Locate C1 – C4 close to their associated pins shown in Figure 16. Refer to Layout Considerations section for guidance on circuit board layout.

Bypass capacitor C5 on the logic supply pin can be omitted if  $V_L$  is connected to  $V_{CC}$ . See the  $V_L$  Logic Supply section for more details about the  $V_L$  logic supply.

NOTE: NOT ALL PINS SHOWN. IN THE CASE OF DUPLICATE PINS FOR  $V_{CC}$ , GND, AND  $V_{EE}$ , EXTERNAL COMPONENTS SHOULD BE POSITIONED CLOSEST TO THE NUMBERED PIN SHOWN ABOVE.

Figure 16. Simplified DC/DC Converter with Required External Components

## APPLICATIONS INFORMATION

### Powering Multiple Devices

Multiple LTC2873 devices can be powered using the boost regulator from only one of the devices, requiring only one inductor (L1) and charge pump cap (C1). Since the RS232 drivers provide the primary load to the circuit, the following guidelines apply:

1. No more than four RS232 drivers can be supplied from a single device.
2. If more than two RS232 drivers are being supplied from a single device, then the inductor, L1, must be increased to 22 $\mu$ H and the charge pump cap, C1, must be increased to 470nH, and  $V_{DD}$  and  $V_{EE}$  bypass caps must be increased to 2.2 $\mu$ F.
3. Ground the SW pin on devices with inactive boost converters.
4. Connect CAP pins together for all devices.
5. Connect  $V_{EE}$  pins together for all devices.
6. Connect  $V_{DD}$  pins together for all devices.

Figure 32 shows an example of how to connect four devices.

### Inductor Selection

A 10 $\mu$ H or 22 $\mu$ H ( $\pm 20\%$ ) inductor with a saturation current ( $I_{SAT}$ ) rating of at least 220mA and a DCR (copper wire resistance) of less than 1.3 $\Omega$  is required. Some very small inductors meeting these requirements are listed in Table 1.

### Capacitor Selection

The small size of ceramic capacitors makes them ideal for the LTC2873. Use X5R or X7R dielectric types; their ESR is low and they retain their capacitance over relatively

wide voltage and temperature ranges. Use a voltage rating of at least 10V.

### Running with External $V_{DD}$ and $V_{EE}$ Supplies

The inductor and charge pump cap, C1, can be omitted only if  $V_{DD}$  and  $V_{EE}$  are externally supplied. Bypass caps on  $V_{DD}$  and  $V_{EE}$  must remain in place. In this circumstance, ground the SW pin and float the CAP pin. External supplies must not exceed the absolute maximum levels of  $\pm 7.5V$ . Ideal supply levels are 7.2V and  $-6.5V$  as these are each just wider than the regulation points of 7.0V and  $-6.3V$  so the internal feedback is satisfied and the switching stops. Lower voltages can be used even at  $-6V$  and  $+6V$  but the internal boost regulator will be switching. This may cause some switching noise but will not harm the part.  $V_{DD}$  and  $V_{EE}$  supplies must be present for proper operation in RS232 mode and in RS485 mode when the termination is enabled. It is okay to run the LTC2873 in RS485 mode with internal termination disabled ( $\overline{TE485}$  high), when  $V_{DD}$  and  $V_{EE}$  are not present or fully settled.

### Inrush Current and Supply Overshoot Precaution

In certain applications, fast supply slew rates are generated when power is connected. If the  $V_{CC}$  voltage is greater than 4.5V and its rise time is faster than 10 $\mu$ s, the pins  $V_{DD}$  and SW can exceed their absolute maximum values during start-up. When supply voltage is applied to  $V_{CC}$ , the voltage difference between  $V_{CC}$  and  $V_{DD}$  generates inrush current flowing through inductor L1 and capacitors C1 and C2. The peak inrush current must not exceed 2A. To avoid this condition, add a 1 $\Omega$  resistor as shown in Figure 17. This precaution is not relevant for supply voltages below 4.5V or rise times longer than 10 $\mu$ s.

Table 1. Recommended Inductors

PART NUMBER	L ( $\mu$ H)	$I_{SAT}$ (mA)	MAX DCR ( $\Omega$ )	SIZE (mm)	MANUFACTURER

## APPLICATIONS INFORMATION

**Figure 17. Supply Current Overshoot Protection for Input Supplies of 4.5V or Higher and Rise Times Faster Than 10μs**

### V<sub>L</sub> Logic Supply and Logic Pins

A separate logic supply pin V<sub>L</sub> allows the LTC2873 to interface with any logic signal from 1.7V to 5.5V. All logic I/Os use V<sub>L</sub> as their high supply. For proper operation, V<sub>L</sub> should not be greater than V<sub>CC</sub>. During power-up, if V<sub>L</sub> is higher than V<sub>CC</sub>, the device will not be damaged, but behavior of the device is not guaranteed. In particular, supply currents can be somewhat higher than specified. If V<sub>L</sub> is not connected to V<sub>CC</sub>, bypass V<sub>L</sub> with a 0.1μF capacitor to GND.

RS232 and RS485 driver outputs are undriven and the RS485 termination resistors are disabled when V<sub>L</sub> or V<sub>CC</sub> is grounded or V<sub>CC</sub> is disconnected.

Although all logic input pins reference V<sub>L</sub> as their high supply, they can be driven up to 7V, independent of V<sub>L</sub> and V<sub>CC</sub>, with the exception of SHDN, which must not exceed V<sub>L</sub> by more than 0.3V. Logic input pins do not have internal biasing devices to pull them up or down. They must be driven high or low to establish valid logic levels; do not float.

### RS485 Driver

The RS485 driver provides full RS485/RS422 compatibility. When enabled, if DI is high, (A/DO to B/RI) is positive. With the driver disabled, the A/DO and B/RI resistance is

greater than 96kΩ (typically 125kΩ) to ground over the entire common mode range of –7V to +12V. This resistance is actually the RS485 receiver input resistance, which is connected to the same pins.

### RS232 Driver with Speed Selection

The RS232 driver provides full compatibility with the TIA/EIA-232-F (RS232) specification. When in RS232 mode, the driver is automatically enabled. Like all RS232 drivers, it is inverting, so that when the input, DI, is low, the output, A/DO, is high, and vice-versa.

The RS232 driver slew rate can be selected to support data rates of up to 250kbps or 1Mbps with the DE485/F232 pin. Since RS232 signals are single ended and large amplitude, compared with RS485, radiated emissions may be a concern. To minimize emissions, the speed selection should be set to Slow mode by setting DE485/F232 low for data rates of 250kbps or less. For higher data rates, up to 1Mbps, Fast mode must be engaged by setting DE485/F232 high. Even in Fast mode the driver transitions are slew controlled to minimize emissions. See "Typical Performance Characteristics" section for examples of the waveforms.

### Driver Overvoltage and Overcurrent Protection

The RS232 and RS485 driver outputs are protected from short circuits to any voltage within the absolute maximum range of ±15V. The maximum current in this condition is 90mA for the RS232 driver and 250mA for the RS485 driver. If the RS485 driver output is shorted to a voltage greater than V<sub>CC</sub>, when it is active, positive current of about 100mA can flow from the driver output back to V<sub>CC</sub>. If the system power supply or loading cannot sink this excess current, clamp V<sub>CC</sub> to GND with a Zener diode (e.g., 5.6V, 1W, 1N4734) to prevent an overvoltage condition on V<sub>CC</sub>.

All devices also feature thermal shutdown protection that disables the drivers, receivers, and RS485 terminators in case of excessive power dissipation during momentary overload conditions. Overtemperature protection activates at a junction temperature exceeding about 165°C (not tested in production). NOTE: Continuous operation above the specified maximum operating junction temperature may result in device degradation or failure.

## TYPICAL APPLICATIONS

### RS485 Balanced Receiver with Full Failsafe Operation

The LTC2873 RS485 receiver has a differential threshold voltage that is about +110mV for signals that are rising and -110mV for signals that are falling, as illustrated in Figure 18. If a differential input signal lingers in the window between these thresholds for more than about 0.7 $\mu$ s, the rising threshold changes from +110mV to -70mV, while the falling threshold remains at -110mV. Thus, differential inputs that are shorted, open, or terminated but not driven for more than 0.7 $\mu$ s produce a high on the receiver output, indicating a failsafe condition.

**Figure 18. RS485 Receiver Input Threshold Characteristics with Typical Values Shown**

The benefit of this dual threshold architecture is that it supports full failsafe operation yet offers a balanced threshold, centered on 0V, for normal data signals. This balance preserves duty cycle for small input signals with heavily slewed edges, typical of what might be seen at the end of a very long cable. This performance is highlighted in Figure 19, where a signal is driven through 4000ft of CAT-5e cable at 3Mbps. Even though the differential signal peaks are at only 200mV and is heavily slewed, the output maintains a nearly perfect signal with almost no duty cycle distortion.

An additional benefit of the balanced architecture is excellent noise immunity due to the wide effective differential input signal hysteresis of 220mV for signals transitioning through the window region in less than 0.7 $\mu$ s. Increasingly slower signals will have increasingly less effective hysteresis, limited by the DC failsafe hysteresis of about 40mV.

**Figure 19. A 3Mbps Signal Driven Down 4000ft of CAT-5e Cable. Top Traces: Received Signals After Transmission Through Cable; Middle Trace: Math Showing Differences of Top Two Signals; Bottom Trace: Receiver Output**

### RS485 Biasing Network Not Required

RS485 networks are often biased with a resistive divider to generate a differential voltage of  $\geq 200$ mV on the data lines, which establishes a logic-high state when all the transmitters on the network are disabled. The values of the biasing resistors depend on the number and type of transceivers on the line and the number and value of terminating resistors. Therefore, the values of the biasing resistors must be customized to each specific network installation, and may change if nodes are added to or removed from the network.

The internal failsafe feature of the LTC2873 eliminates the need for external network biasing resistors provided they are used in a network of transceivers with similar internal failsafe features. This also allows the network to support a high number of nodes, up to 256, by eliminating the bias resistor loading. The LTC2873 transceiver operates correctly on biased, unbiased, or under-biased networks.

If a twisted pair has unbalanced capacitance from its two conductors to AC ground, common mode transients can translate into small differential voltages. If the common mode event is large and fast enough, the resulting differential voltage can cause a receiver, whose inputs are

## APPLICATIONS INFORMATION

undriven, to change state momentarily. In these extreme conditions, high quality shielded cable is recommended. If necessary, biasing resistors can be used on the bus to pull the resting signal farther from the receivers failsafe threshold.

### Receiver Outputs

The RS232 and RS485 receiver outputs are internally driven high (to  $V_L$ ) or low (to GND) with no external pull up needed. When the receivers are disabled the output pin becomes Hi-Z with leakage of less than  $\pm 5\mu\text{A}$  for voltages within the  $V_L$  supply range.

### RS485 Receiver Input Resistance

In RS485 mode, the RS485 receiver input resistance from A/DO or B/RI to GND is  $125\text{k}\Omega$  (typical) when the integrated termination is disabled. This permits up to a total of 256 receivers per system without exceeding the RS485 receiver loading specification. The input resistance of the receiver is unaffected by enabling/disabling the receiver or whether the part is in loopback mode, or unpowered. The equivalent input resistance looking into the RS485 receiver pins is shown in Figure 20.

Figure 20. Equivalent RS485 Receiver Input Resistance Into A/DO and B/RI

### RS232 Receiver Input Resistance

In RS232 mode, the receiver input resistance on the B/RI pin is always  $5\text{k}\Omega$  to GND. In any other mode, this resistor is switched out. The  $120\Omega$  RS485 termination resistor between pins A/DO and B/RI is never engaged in RS232 mode, regardless of the state of  $\overline{\text{TE485}}$  pin.

### Selectable RS485 Termination

Proper cable termination is important for good signal fidelity. When the cable is not terminated with its characteristic impedance, reflections cause waveform distortion.

The LTC2873 offers an integrated switchable  $120\Omega$  termination resistor between pins A/DO and B/RI.

This termination supports communication over a twisted pair cable with characteristic impedance of  $120\Omega$  or  $100\Omega$ , including CAT-5 cables. It has the advantage of being able to easily change, through logic control, the proper line termination for correct operation when configuring transceiver networks. Termination should be enabled on transceivers positioned at both ends of the network bus only. However, the driving end of a line does not need to be terminated. By turning off termination at the driver, the reduced load results in less power dissipation and a larger signal swing on the bus.  $\overline{\text{TE485}}$  can be tied to DE485/F232 to logically switch the termination on only when the driver is inactive if the termination enable/disable delays can be tolerated in the overall system level timing. If the delays are not acceptable, tie  $\overline{\text{TE485}}$  low to enable termination for all modes of RS485 operation, whether driving or receiving.

The termination resistance is maintained over the entire RS485 common mode range of  $-7\text{V}$  to  $12\text{V}$  as shown in Figure 21. The voltage across pins with the terminating resistor enabled should not exceed  $6\text{V}$  as indicated in the Absolute Maximum Ratings table.

Figure 21. Typical Resistance of the Enabled RS485 Terminator vs Common Mode Voltage of A/DO and B/RI

## APPLICATIONS INFORMATION

### Logic Loopback

A loopback mode connects the driver inputs to the receiver outputs (non-inverting) providing an echo for self-test. This applies to both RS232 and RS485 transceivers. Loopback mode is entered when the LB pin is set to a logic-high and the relevant receiver is enabled. The RS485 driver output can be disabled in loopback mode if DE485/F232 is held low, or functions normally with DE485/F232 high. The RS232 driver output cannot be disabled when loopback is engaged in RS232 mode, and functions normally. The loopback signal traverses a path from the logic input circuit at DI to the logic output at RO and does not exercise the entire driver or receiver circuit. Thus loopback, alone, is not a sufficient test to ensure full functionality of the LTC2873. Loopback does not affect the operation of the termination resistors.

### Robust ESD Protection

The LTC2873 features exceptionally robust ESD protection. The transceiver interface pins (A and B) are protected to  $\pm 26\text{kV}$  human body model with respect to GND,  $V_{CC}$ , or  $V_L$  without latchup or damage. This protection holds whether the device is unpowered or powered in any mode of operation. To note,  $\pm 26\text{kV}$  is an upper limit of the tester—the actual device protection level is higher. Every other pin on the device is protected to  $\pm 4\text{kV}$  ESD (HBM) for all-around robustness. Figure 22 shows the LTC2873 being struck repeatedly with 26kV of ESD energy (air gap discharge) during operation with no damage or circuit latchup.

### RS485 Cable Length vs Data Rate

Many factors contribute to the maximum cable length that can be used for RS485 or RS422 communication, including driver transition times, receiver threshold, duty

Figure 22. LTC2873 Struck Repeatedly with 26kV of ESD Energy While Operating. No Damage or Circuit Latchup Occurs

REV B

## APPLICATIONS INFORMATION

cycle distortion, cable properties and data rate. A typical curve of cable length versus maximum data rate is shown in Figure 23. Various regions of this curve reflect different performance limiting factors in data transmission.

At frequencies below 100kbps, the maximum cable length is determined by DC resistance in the cable. In this example, a cable longer than 4000ft will attenuate the signal at the far end to less than what can be reliably detected by the receiver.

For data rates above 100kbps, the capacitive and inductive properties of the cable begin to dominate this relationship. The attenuation of the cable is frequency and length dependent, resulting in increased rise and fall times at the far end of the cable. At high data rates or long cable lengths, these transition times become a significant part of the signal bit time. Jitter and inter symbol interference aggravate this so that the time window for capturing valid data at the receiver becomes impossibly small.

The boundary at 20Mbps in Figure 23 represents the guaranteed maximum operating rate of the LTC2873. The dashed vertical line at 10Mbps represents the specified maximum data rate in the RS485 standard. This boundary is not a limit, but reflects the maximum data rate that the specification was written for. It should be emphasized that the plot in Figure 23 shows a typical relation between maximum data rate and cable length. Results with the LTC2873 will vary, depending on cable properties such as conductor gauge, characteristic impedance, insulation material, and solid versus stranded conductors.

**Figure 23. Cable Length vs Data Rate**  
(RS485/RS422 Standard Shown in Vertical Dashed Line)

### Layout Considerations

All  $V_{CC}$  pins must be connected together and all ground pins must be connected together on the PC board with very low impedance traces or dedicated planes. A 2.2 $\mu$ F, or larger, bypass capacitor should be placed less than 7mm away from  $V_{CC}$  Pin 14. This  $V_{CC}$  pin, as well as GND Pin 11, mainly service the DC/DC converter. Additional bypass capacitors of 0.1 $\mu$ F or larger, can be added from  $V_{CC}$  pin 18 to ground pin 16 if the traces back to the 2.2 $\mu$ F capacitor are indirect or narrow. These  $V_{CC}$  and ground pins mainly service the RS485 driver. Table 2 summarizes the bypass capacitor requirements. The capacitors listed in the table should be placed closest to their respective supply and ground pin.

**Table 2. Bypass Capacitor Requirements**

CAPACITOR ( $\mu$ F)	SUPPLY (PIN)	RETURN (PIN)	COMMENT
2.2	$V_{CC}$ (14)	GND (11)	Required
1.0	$V_{DD}$ (13)	GND (11)	Required
1.0	$V_{EE}$ (10)	GND (11)	Required
0.1	$V_L$ (22)	GND (20)	Required*
0.1	$V_{CC}$ (18)	GND (16)	Optional
0.1	$V_{CC}$ (21)	GND (20)	Optional

\*If  $V_L$  is not connected to  $V_{CC}$ .

Place the charge pump capacitor, C1, directly adjacent to the SW and CAP pins, with no more than one centimeter of total trace length to maintain low inductance. Close placement of the inductor, L1, is of secondary importance compared to the placement of C1 but should include no more than two centimeters of total trace length.

The PC board traces connected to high speed bus signals A/DO and B/RI should be symmetrical and as short as possible to minimize capacitive imbalance and to maintain good differential signal integrity. To minimize capacitive loading effects, the differential signals should be separated by more than the width of a trace and should not be routed on top of each other if they are on different signal planes.

Care should be taken to route outputs away from any sensitive inputs to reduce feedback effects that might cause noise, jitter, or even oscillations. For example, DI, A/DO, and B/RI should not be routed near RO.

		Corrected recommended Würth inductor part number.	17
B	04/18	Updated plot RS485 Driver Short-Circuit Current vs Short-Circuit Voltage.	7
		Changed the approximate failsafe timeout from 1.3 $\mu$ s to 0.7 $\mu$ s.	20
		Corrected a pin state in Figure 25 for the RS485 RX configuration.	24
		Added a new Typical Application circuit.	32
		Added LTM2885 to the Related Parts Table.	32

## TYPICAL APPLICATION

## 2500V<sub>RMS</sub> Isolated RS485/RS232 Transceiver with Isolated Power

## RELATED PARTS

PART NUMBER	DESCRIPTION	COMMENTS
<a href="#">LTC2870, LTC2871</a>	RS232/RS485 Multiprotocol Transceiver with Integrated Termination	Two RS232 and One RS485 Transceivers. 3V to 5.5V Supply, Automatic Selection of Termination Resistors, Duplex Control, Logic Supply Pin, Up to $\pm 26\text{kV}$ ESD
<a href="#">LTC2872</a>	RS232/RS485 Dual Multiprotocol Transceiver with Integrated Termination	Four RS232 and Two RS485 Transceivers. 3V to 5.5V Supply, Automatic Selection of Termination Resistors, Duplex Control, Logic Supply Pin, $\pm 15\text{kV}$ ESD
<a href="#">LTC1334</a>	Single 5V RS232/RS485 Multiprotocol Transceiver	Dual Port, Single 5V Supply, Configurable, $\pm 10\text{kV}$ ESD
<a href="#">LTC1387</a>	Single 5V RS232/RS485 Multiprotocol Transceiver	Single Port, Configurable
<a href="#">LTC2801/LTC2802/ LTC2803/LTC2804</a>	1.8V to 5.5V RS232 Single and Dual Transceivers	Up to 1Mbps, $\pm 10\text{kV}$ ESD, Logic Supply Pin, Tiny DFN Packages
<a href="#">LTC2854/LTC2855</a>	3.3V 20Mbps RS485 Transceiver with Integrated Switchable Termination	3.3V Supply, Integrated, Switchable, $120\Omega$ Termination Resistor, $\pm 25\text{kV}$ ESD
<a href="#">LTC2859/LTC2861</a>	20Mbps RS485 Transceiver with Integrated Switchable Termination	5V Supply, Integrated, Switchable, $120\Omega$ Termination Resistor, $\pm 15\text{kV}$ ESD
<a href="#">LTM<sup>®</sup>2881</a>	Complete Isolated RS485/RS422 $\mu\text{Module}^{\text{®}}$ Transceiver + Power	20Mbps, $2500\text{V}_{\text{RMS}}$ Isolation with Integrated DC/DC Converter, Integrated Switchable $120\Omega$ Termination Resistor, $\pm 15\text{kV}$ ESD
<a href="#">LTM2885</a>	$6500\text{V}_{\text{RMS}}$ Isolated RS485/RS232 $\mu\text{Module}$ Transceiver + Power	20Mbps, $6500\text{V}_{\text{RMS}}$ Isolation with Integrated DC/DC Converter, Integrated Switchable $120\text{ohm}$ Termination Resistor, $\pm 15\text{kV}$ ESD, 5V Supply
<a href="#">LTM2882</a>	Dual Isolated RS232 $\mu\text{Module}$ Transceiver + Power	1Mbps, $2500\text{V}_{\text{RMS}}$ Isolation with Integrated DC/DC Converter, $\pm 10\text{kV}$ ESD
