PSoC® Functional Overview

The PSoC family consists of on-chip controller devices, which are designed to replace multiple traditional microcontroller unit (MCU)-based components with one, low cost single-chip programmable component. A PSoC device includes configurable analog and digital blocks, and programmable interconnect. This architecture allows the user to create customized peripheral configurations, to match the requirements of each individual application. Additionally, a fast CPU, flash program memory, SRAM data memory, and configurable I/O are included in a range of convenient pinouts.

The architecture for this device family, as shown in the Logical Block Diagram on page 2, consists of three main areas:

- The Core
- CapSense Analog System
- WirelessUSB-NL System
- System Resources.

A common, versatile bus allows connection between I/O and the analog system.

Each CYRF89435 device includes a dedicated CapSense block that provides sensing and scanning control circuitry for capacitive sensing applications. The 13 GPIOs provide access to the MCU and analog mux.

PSoC Core

The PSoC Core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and IMO and ILO. The CPU core, called the M8C, is a powerful processor with speeds up to 24 MHz. The M8C is a 4-MIPS, 8-bit Harvard-architecture microprocessor.

CapSense System

The analog system contains the capacitive sensing hardware. Several hardware algorithms are supported. This hardware performs capacitive sensing and scanning without requiring external components. The analog system is composed of the CapSense PSoC block and an internal 1 V or 1.2 V analog reference, which together support capacitive sensing of up to 13 inputs. Capacitive sensing is configurable on each GPIO pin. Scanning of enabled CapSense pins are completed quickly and easily across multiple ports.

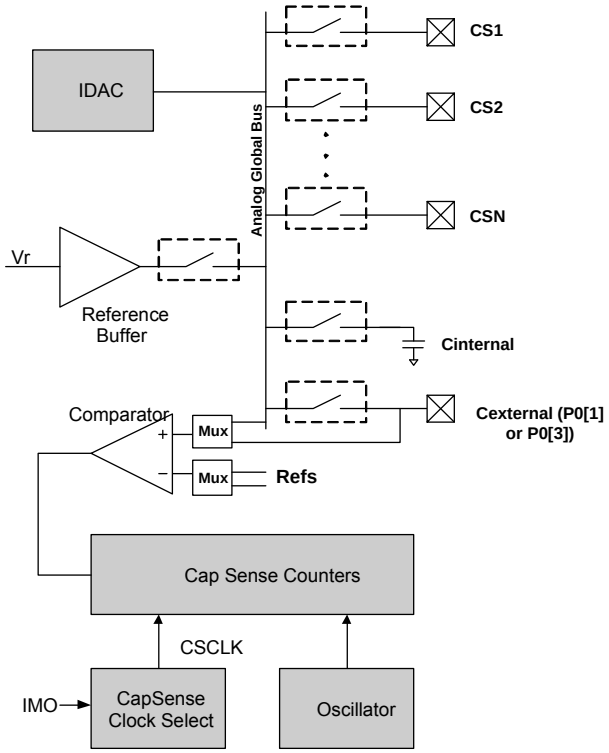
SmartSense

SmartSense is an innovative solution from Cypress that removes manual tuning of CapSense applications. This solution is easy to use and provides a robust noise immunity. It is the only auto-tuning solution that establishes, monitors, and maintains all required tuning parameters. SmartSense allows engineers to go from prototyping to mass production without re-tuning for manufacturing variations in PCB and/or overlay material properties.

SmartSense_EMC

In addition to the SmartSense auto-tuning algorithm to remove manual tuning of CapSense applications, SmartSense_EMC user module incorporates a unique algorithm to improve robustness of capacitive sensing algorithm/circuit against high frequency conducted and radiated noise. Every electronic device must comply with specific limits for radiated and conducted external noise and these limits are specified by regulatory bodies (for example, FCC, CE, U/L and so on). A very good PCB layout design, power supply design and system design is a mandatory for a product to pass the conducted and radiated noise tests. An ideal PCB layout, power supply design or system design is not often possible because of cost and form factor limitations of the product. SmartSense_EMC with superior noise immunity is well suited and handy for such applications to pass radiated and conducted noise test.

Figure 1. CapSense System Block Diagram



Analog Multiplexer System

The Analog Mux Bus can connect to every GPIO pin. Pins are connected to the bus individually or in any combination. The bus also connects to the analog system for analysis with the CapSense block comparator.

Switch control logic enables selected pins to precharge continuously under hardware control. This enables capacitive measurement for applications such as touch sensing. Other multiplexer applications include:

- Complex capacitive sensing interfaces, such as sliders and touchpads.
- Chip-wide mux that allows analog input from any I/O pin.
- Crosspoint connection between any I/O pin combinations.

WirelessUSB-NL System

WirelessUSB-NL, optimized to operate in the 2.4-GHz ISM band, is Cypress's third generation of 2.4-GHz low-power RF technology. WirelessUSB-NL implements a Gaussian frequency-shift keying (GFSK) radio using a differentiated single-mixer, closed-loop modulation design that optimizes power efficiency and interference immunity. Closed-loop modulation effectively eliminates the problem of frequency drift, enabling WirelessUSB-NL to transmit up to 255-byte payloads without repeatedly having to pay power penalties for re-locking the phase-locked loop (PLL) as in open-loop designs

Among the advantages of WirelessUSB-NL are its fast lock times and channel switching, along with the ability to transmit larger payloads. Use of longer payload packets, compared to multiple short payload packets, can reduce overhead, improve overall power efficiency, and help alleviate spectrum crowding.

Combined with Cypress's Capacitive touch sense controllers, WirelessUSB-NL also provides the lowest bill of materials (BOM) cost solution for sophisticated PC peripheral applications such as wireless keyboards and mice, as well as best-in-class wireless performance in other demanding applications. such as toys, remote controls, fitness, automation, presenter tools, and gaming.

With PRoC-CS, the WirelessUSB-NL transceiver can add wireless capability to a wide variety of CapSense applications.

The WirelessUSB-NL is a fully-integrated CMOS RF transceiver, GFSK data modem, and packet framer, optimized for use in the 2.4-GHz ISM band. It contains transmit, receive, RF synthesizer, and digital modem functions, with few external components. The transmitter supports digital power control. The receiver uses extensive digital processing for excellent overall performance, even in the presence of interference and transmitter impairments.

The product transmits GFSK data at approximately 0-dBm output power. Sigma-Delta PLL delivers high-quality DC-coupled transmit data path.

The low-IF receiver architecture produces good selectivity and image rejection, with typical sensitivity of –87 dBm or better on most channels. Sensitivity on channels that are integer multiples of the crystal reference oscillator frequency (12 MHz) may show approximately 5 dB degradation. Digital RSSI values are available to monitor channel quality.

On-chip transmit and receive FIFO registers are available to buffer the data transfer with MCU. Over-the-air data rate is always 1 Mbps even when connected to a slow, low-cost MCU. Built-in CRC, FEC, data whitening, and automatic retry/acknowledge are all available to simplify and optimize performance for individual applications.

For more details on the radio's implementation details and timing requriements, please go through the WirelessUSB-NL datasheet in www.cypress.com.

Transmit Power Control

The following table lists recommended settings for register 9 for short-range applications, where reduced transmit RF power is a desirable trade off for lower current.

Table 1. Transmit Power Control

Power Setting Description	Typical Transmit Power (dBm)	Value of Register 9	
		Silicon ID 0x1002	Silicon ID 0x2002
PA0 - Highest power	+1	0x1820	0x7820
PA2 - High power	0	0x1920	0x7920
PA4 - High power	–3	0x1A20	0x7A20
PA8 - Low power	–7.5	0x1C20	0x7C20
PA12 - Lower power	–11.2	0x1E20	0x7E20

Note: Silicon ID can be read from Register 31.

Power-on and Register Initialization Sequence

For proper initialization at power up, V_{IN} must ramp up at the minimum overall ramp rate no slower than shown by T_{VIN} specification in the following figure. During this time, the RST_n line must track the V_{IN} voltage ramp-up profile to within approximately 0.2 V. Since most MCU GPIO pins automatically default to a high-Z condition at power up, it only requires a pull-up resistor. When power is stable and the MCU POR releases, and MCU begins to execute instructions, RST_n must then be pulsed low as shown in Figure 13 on page 31, followed by writing Reg[27 = 0x4200. During or after this SPI transaction, the State Machine status can be read to confirm FRAMER_ST= 1, indicating a proper initialization.

Additional System Resources

System resources provide additional capability, such as configurable I^2C slave, SPI master/slave communication interface, three 16-bit programmable timers, and various system resets supported by the M8C.

These system resources provide additional capability useful to complete systems. Additional resources include low voltage detection and power-on reset. The merits of each system resource are listed here:

- The I^2C slave/SPI master-slave module provides 50/100/400 kHz communication over two wires. SPI communication over three or four wires runs at speeds of 46.9 kHz to 3 MHz (lower for a slower system clock).
- Low-voltage detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced power-on reset (POR) circuit eliminates the need for a system supervisor.
- An internal reference provides an absolute reference for capacitive sensing.
- A register-controlled bypass mode allows the user to disable the LDO regulator.

Getting Started

The quickest way to understand the PRoC-CS silicon is to read this datasheet and then use the PSoC Designer Integrated Development Environment (IDE). This datasheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications.

For in depth information, along with detailed programming details, see the Technical Reference Manual for the CapSense devices.

For up-to-date ordering, packaging, and electrical specification information, see the latest PSoC device datasheets on the web at www.cypress.com/psoc.

Development Tools

PSoC Designer™ is the revolutionary integrated design environment (IDE) that you can use to customize PSoC to meet your specific application requirements. PSoC Designer software accelerates system design and time to market. Develop your applications using a library of precharacterized analog and digital peripherals (called user modules) in a drag-and-drop design environment. Then, customize your design by leveraging the dynamically generated application programming interface (API) libraries of code. Finally, debug and test your designs with the integrated debug environment, including in-circuit emulation and standard software debug features. PSoC Designer includes:

- Application editor graphical user interface (GUI) for device and user module configuration and dynamic reconfiguration
- Extensive user module catalog
- Integrated source-code editor (C and assembly)
- Free C compiler with no size restrictions or time limits
- Built-in debugger
- In-circuit emulation
- Built-in support for communication interfaces:
  - Hardware and software I^2C slaves and masters
  - SPI master and slave, and wireless

PSoC Designer supports the entire library of PSoC 1 devices and runs on Windows XP, Windows Vista, and Windows 7.

PSoC Designer Software Subsystems

Design Entry

In the chip-level view, choose a base device to work with. Then select different onboard analog and digital components that use the PSoC blocks, which are called user modules. Examples of user modules are analog-to-digital converters (ADCs), digital-to-analog converters (DACs), amplifiers, and filters. Configure the user modules for your chosen application and connect them to each other and to the proper pins. Then generate your project. This prepopulates your project with APIs and libraries that you can use to program your application.

The tool also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic reconfiguration makes it possible to change configurations at run time. In essence, this lets you to use more than 100 percent of PSoC's resources for an application.

Code Generation Tools

The code generation tools work seamlessly within the PSoC Designer interface and have been tested with a full range of debugging tools. You can develop your design in C, assembly, or a combination of the two.

Assemblers. The assemblers allow you to merge assembly code seamlessly with C code. Link libraries automatically use absolute addressing or are compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compilers. C language compilers are available that support the PSoC family of devices. The products allow you to create complete C programs for the PSoC family devices. The optimizing C compilers provide all of the features of C, tailored to the PSoC architecture. They come complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

PSoC Designer has a debug environment that provides hardware in-circuit emulation, allowing you to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow you to read and program and read and write data memory, and read and write I/O registers. You can read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also lets you to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system displays online, context-sensitive help. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer.

In-Circuit Emulator

A low-cost, high-functionality in-circuit emulator (ICE) is available for development support. This hardware can program single devices.

The emulator consists of a base unit that connects to the PC using a USB port. The base unit is universal and operates with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full-speed (24 MHz) operation.

Designing with PSoC Designer

The development process for the PSoC device differs from that of a traditional fixed-function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and lowering inventory costs. These configurable resources, called PSoC blocks, have the ability to implement a wide variety of user-selectable functions. The PSoC development process is:

1. Select user modules.
2. Configure user modules.
3. Organize and connect.
4. Generate, verify, and debug.

Select User Modules

PSoC Designer provides a library of prebuilt, pretested hardware peripheral components called “user modules”. User modules make selecting and implementing peripheral devices, both analog and digital, simple.

Configure User Modules

Each user module that you select establishes the basic register settings that implement the selected function. They also provide parameters and properties that allow you to tailor their precise configuration to your particular application. For example, a PWM User Module configures one or more digital PSoC blocks, one for each eight bits of resolution. Using these parameters, you can establish the pulse width and duty cycle. Configure the parameters and properties to correspond to your chosen application. Enter values directly or by selecting values from drop-down menus. All of the user modules are documented in datasheets that may be viewed directly in PSoC Designer or on the Cypress website. These user module datasheets explain the internal operation of the user module and provide performance specifications. Each datasheet describes the use of each user module parameter, and other information that you may need to successfully implement your design.

Organize and Connect

Build signal chains at the chip level by interconnecting user modules to each other and the I/O pins. Perform the selection, configuration, and routing so that you have complete control over all on-chip resources.

Generate, Verify, and Debug

When you are ready to test the hardware configuration or move on to developing code for the project, perform the “Generate Configuration Files” step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the software for the system. The generated code provides APIs with high-level functions to control and respond to hardware events at run time, and interrupt service routines that you can adapt as needed.

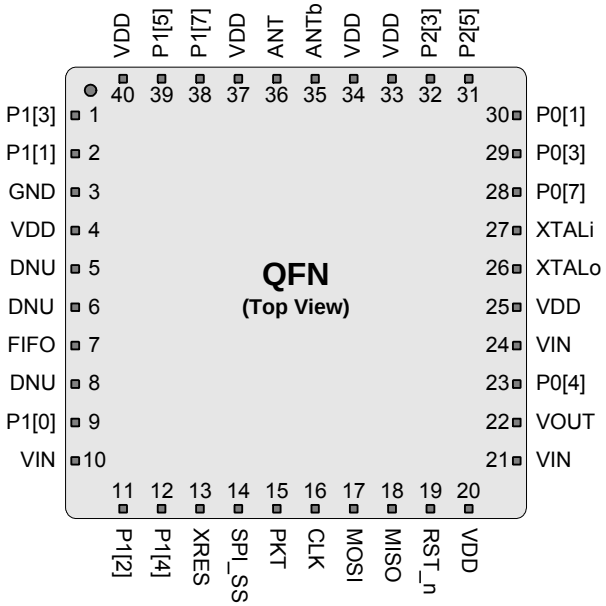
A complete code development environment lets you to develop and customize your applications in C, assembly language, or both.

The last step in the development process takes place inside PSoC Designer’s Debugger (accessed by clicking the Connect icon). PSoC Designer downloads the HEX image to the ICE where it runs at full-speed. PSoC Designer debugging capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint, and watch-variable features, the debug interface provides a large trace buffer. The interface lets you to define complex breakpoint events that include monitoring address and data bus values, memory locations, and external signals.

Pinouts

The CYRF89435 PRoC-CS device is available in a 40-pin QFN package, which is illustrated in the following table. Every port pin (labeled with a “P”) is capable of Digital I/O and connection to the common analog bus. However, V_{DD}, and XRES are not capable of Digital I/O.

Figure 3. 40-pin QFN pinout



Pin Definitions

Pin No	Pin name	Pin Description
1	P1[3]/SCLK [2]	Digital I/O, Analog I/O, SPI CLK
2	P1[1]/MOSI [1]	Digital I/O, Analog I/O, TC CLK, I2C SCL, SPI MOSI
3	GND	Ground connection
4, 20, 25, 33, 34, 37, 40	VDD	Core power supply voltage. Connect all VDD pins to VOUT pin.
5	DNU	Do not use
6	DNU	Do not use
7	FIFO	FIFO status indicator bit
8	DNU	Do not use
9	P1[0] [1]	Analog I/O, Digital I/O, TC DATA, I2C SDA
10, 21, 24	VIN	Unregulated input voltage to the on-chip low drop out (LDO) voltage regulator
11	P1[2]	Analog I/O, Digital I/O
12	P1[4]	Analog I/O, Digital I/O, EXT CLK
13	XRES	Active high external reset with internal pull-down
14	SPI_SS	Enable input for SPI, active low. Also used to bring device out of sleep state.
15	PKT	Transmit/receive packet status indicator bit
16	SPI_CLK	Clock input for SPI interface
17	SPI_MOSI	Data input for the SPI bus
18	SPI_MISO	Data output (tristate when not active)
19	RST_n	RST_n Low: Chip shutdown to conserve power. Register values lost RST_n High: Turn on chip, registers restored to default value
22	VOUT	1.8 V output from on-chip LDO. Connect to all VDD pins, do not connect to external loads.
23	P0[4]	Analog I/O, Digital I/O, VREF
26	XTALO	Output of the crystal oscillator gain block
27	XTALI	Input to the crystal oscillator gain block
28	P0[7]	Analog I/O, Digital I/O,SPI CLK
29	P0[3]	Analog I/O, Digital I/O, Integrating input
30	P0[1]	Analog I/O, Digital I/O, Integrating input
31	P2[5]	Analog I/O, Digital I/O, XTAL Out
32	P2[3]	Analog I/O, Digital I/O, XTAL In
35	ANTb	Differential RF input/output. Each of these pins must be DC grounded, 20 kΩ or less
36	ANT	Differential RF input/output. Each of these pins must be DC grounded, 20 kΩ or less
38	P1[7]/SS_N	Digital I/O, Analog I/O, I2C SCL, SPI SS
39	P1[5]/MISO	Digital I/O, Analog I/O, I2C SDA, SPI MISO

Notes
1. On power-up, the SDA(P1[0]) drives a strong high for 256 sleep clock cycles and drives resistive low for the next 256 sleep clock cycles. The SCL(P1[1]) line drives resistive low for 512 sleep clock cycles and both the pins transition to high impedance state. On reset, after XRES de-asserts, the SDA and the SCL lines drive resistive low for 8 sleep clock cycles and transition to high impedance state. Hence, during power-up or reset event, P1[1] and P1[0] may disturb the I2C bus. Use alternate pins if you encounter issues.
2. Alternate SPI clock.

Absolute Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Table 2. Absolute Maximum Ratings

Symbol	Description	Conditions	Min	Typ	Max	Units
T_{STG}	Storage temperature	Higher storage temperatures reduce data retention time. Recommended Storage Temperature is +25 °C ± 25 °C. Extended duration storage temperatures above 85 °C degrades reliability.	–55	25	125	°C
V_{IN}[3]		–	1.9	–	3.63	V
V_{IO}	DC input voltage	–	–0.5	–	V_{IN} + 0.5	V
V_{IOZ}[4]	DC voltage applied to tristate	–	–0.5	–	V_{IN} + 0.5	V
I_{MIO}	Maximum current into any port pin	–	–25	–	+50	mA
ESD	Electrostatic discharge voltage	Human body model ESD i) RF pins (ANT, ANTb) ii) Analog pins (XTALi, XTALo) iii) Remaining pins	 500 500 2000	–	–	V
LU	Latch-up current	In accordance with JESD78 standard	–	–	140	mA

Operating Temperature

Table 3. Operating Temperature

Symbol	Description	Conditions	Min	Typ	Max	Units
T_A	Ambient temperature	–	0	–	70	°C

Notes
3. Program the device at 3.3 V only. Hence use MiniProg3 only as MiniProg1 does not support programming at 3.3 V.
4. Port1 pins are hot-swap capable with I/O configured in High-Z mode, and pin input voltage above V_{IN}.

DC Chip-Level Specifications

The following table lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 4. DC Chip-Level Specifications

Symbol	Description	Conditions	Min	Typ	Max	Units
V_{IN}[5, 6, 7, 8]	Supply voltage	Refer the table DC POR and LVD Specifications on page 17	1.9	–	3.6	V
I_{DD24}	Supply current, IMO = 24 MHz	Conditions are $V_{IN} \le 3.0$ V, T_A = 25 °C, CPU = 24 MHz. CapSense running at 12 MHz, no I/O sourcing current	–	2.88	4.00	mA
I_{DD12}	Supply current, IMO = 12 MHz	Conditions are $V_{IN} \le 3.0$ V, T_A = 25 °C, CPU = 12 MHz. CapSense running at 12 MHz, no I/O sourcing current	–	1.71	2.60	mA
I_{DD6}	Supply current, IMO = 6 MHz	Conditions are $V_{IN} \le 3.0$ V, T_A = 25 °C, CPU = 6 MHz. CapSense running at 6 MHz, no I/O sourcing current	–	1.16	1.80	mA
$I_{DDAVG10}$	Average supply current per sensor	One sensor scanned at 10 ms rate	–	250	–	µA
$I_{DDAVG100}$	Average supply current per sensor	One sensor scanned at 100 ms rate	–	25	–	µA
$I_{DDAVG500}$	Average supply current per sensor	One sensor scanned at 500 ms rate	–	7	–	µA
I_{SB0}	Deep sleep current	$V_{IN} \le 3.0$ V, T_A = 25 °C, I/O regulator turned off	–	0.10	1.05	µA
I_{SB1}	Standby current with POR, LVD and sleep timer	$V_{IN} \le 3.0$ V, T_A = 25 °C, I/O regulator turned off	–	1.07	1.50	µA
I_{SBI2C}	Standby current with I^2C enabled	Conditions are V_{IN} = 3.3 V, T_A = 25 °C and CPU = 24 MHz	–	1.64	–	µA

Notes

5. If powering down in standby sleep mode, to properly detect and recover from a V_{IN} brown out condition any of the following actions must be taken:
   Bring the device out of sleep before powering down.
   Assure that V_{IN} falls below 100 mV before powering back up.
   Set the No Buzz bit in the OSC_CR0 register to keep the voltage monitoring circuit powered during sleep.
   Increase the buzz rate to assure that the falling edge of V_{IN} is captured. The rate is configured through the PSSDC bits in the SLP_CFG register.
   For the referenced registers, refer to the *CY8C20X36 Technical Reference Manual*. In deep sleep mode, additional low power voltage monitoring circuitry allows V_{IN} brown out conditions to be detected for edge rates slower than 1V/ms.
6. Always greater than 50 mV above V_{PPOR1} voltage for falling supply.
7. Always greater than 50 mV above V_{PPOR2} voltage for falling supply.
8. Always greater than 50 mV above V_{PPOR3} voltage for falling supply.

DC GPIO Specifications

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 2.4 V to 3.0 V and 0 °C ≤ T_A ≤ 70 °C, or 1.9 V to 2.4 V and 0 °C ≤ T_A ≤ 70 °C, respectively. Typical parameters apply to 3.3 V at 25 °C and are for design guidance only.

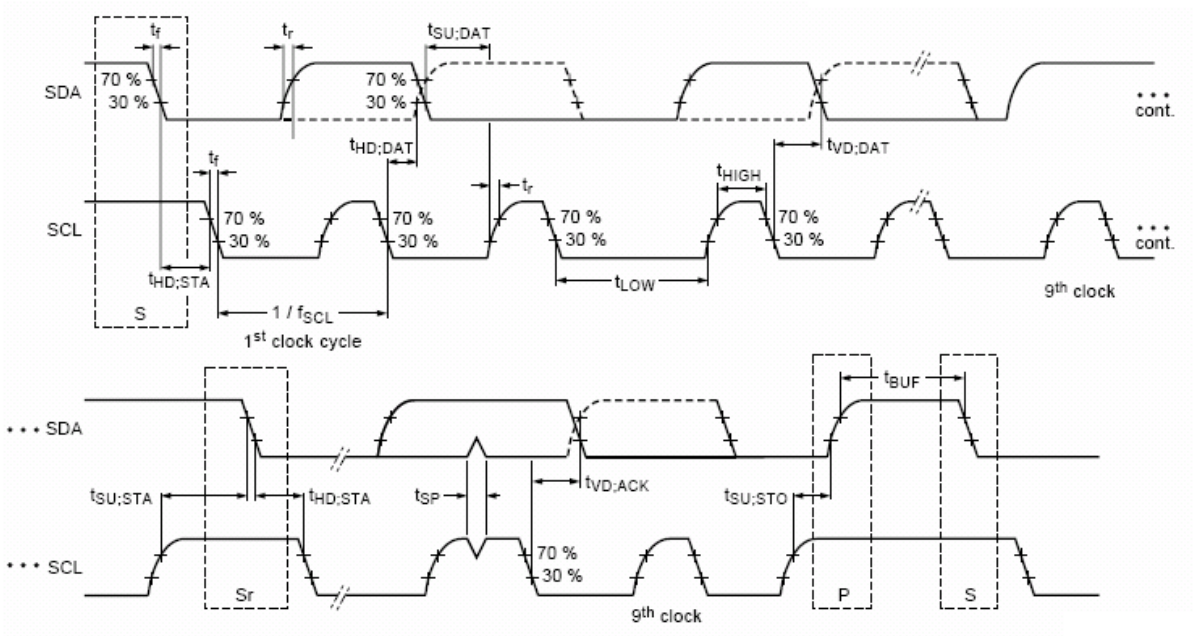
Figure 7. Definition for Timing for Fast/Standard Mode on the I²C Bus



Note

12. A Fast-Mode I²C-bus device can be used in a standard mode I²C-bus system, but the requirement $t_{SU;DAT} \geq 250$ ns must then be met. This automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{rmax} + t_{SU;DAT} = 1000 + 250 = 1250$ ns (according to the Standard-Mode I²C-bus specification) before the SCL line is released.

■ After register initialization, CYRF89435 is ready to transmit or receive.

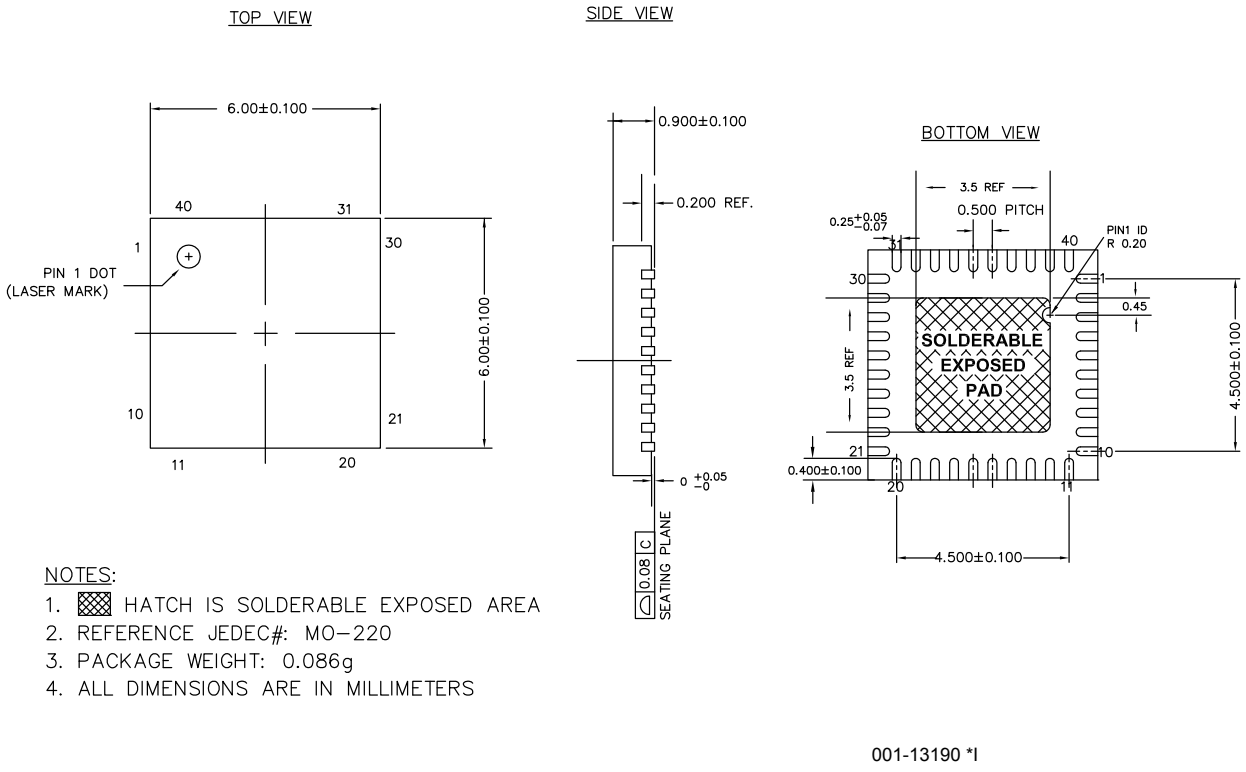
Packaging Information

This section illustrates the packaging specifications for the CY7C89435 PSoC device, along with the thermal impedances for each package.

Important Note

Emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the emulation tools' dimensions, refer to the document titled *PSoC Emulator Pod Dimensions* at http://www.cypress.com/design/MR10161.

Figure 14. 40-pin QFN (6 × 6 × 1.0 mm) LT40B 3.5 × 3.5 mm E-Pad (Sawn) Package Outline, 001-13190



Important Notes

- For information on the preferred dimensions for mounting QFN packages, see the following Application Note at http://www.amkor.com/products/notes_papers/MLFAppNote.pdf.
- Pinned vias for thermal conduction are not required for the low power PSoC device.

Thermal Impedances

Table 26. Thermal Impedances per Package

Package	Typical θ_{JA} [13]	Typical θ_{JC}
40-pin QFN [14]	27°C/W	34°C/W

Capacitance on Crystal Pins

Table 27. Typical Package Capacitance on Crystal Pins

Package	Package Capacitance
40-pin QFN	36 pF

Solder Reflow Specifications

Table 28 shows the solder reflow temperature limits that must not be exceeded.

Table 28. Solder Reflow Specifications

Package	Minimum Peak Temperature	Maximum Peak Temperature
40-pin QFN	260 °C	265 °C

Notes
13. $T_J = T_A + \text{Power} \times \theta_{JA}$.
14. To achieve the thermal impedance specified for the QFN package, the center thermal pad must be soldered to the PCB ground plane.

Development Tool Selection

Software

PSoC Designer™

At the core of the PSoC development software suite is PSoC Designer. Utilized by thousands of PSoC developers, this robust software has been facilitating PSoC designs for over half a decade. PSoC Designer is available free of charge at http://www.cypress.com.

PSoC Programmer

Flexible enough to be used on the bench in development, yet suitable for factory programming, PSoC Programmer works either as a standalone programming application or it can operate directly from PSoC Designer. PSoC Programmer software is compatible with both PSoC ICE-Cube In-Circuit Emulator and PSoC MiniProg. PSoC Programmer is available free of charge at http://www.cypress.com.

Development Kits

All development kits are sold at the Cypress Online Store.

CY3215-DK Basic Development Kit

The CY3215-DK is for prototyping and development with PSoC Designer. This kit supports in-circuit emulation and the software interface enables users to run, halt, and single step the processor and view the content of specific memory locations. PSoC Designer supports the advance emulation features also. The kit includes:

- PSoC Designer Software CD
- ICE-Cube In-Circuit Emulator
- ICE Flex-Pod for CY8C29X66A Family
- Cat-5 Adapter
- Mini-Eval Programming Board
- 110 ~ 240 V Power Supply, Euro-Plug Adapter
- iMAGEcraft C Compiler (Registration Required)
- ISSP Cable
- 2 CY8C29466A-24PXI 28-pin PDIP Chip Samples

Device Programmers

Firmware needs to be downloaded to PRoC CS device only at 3.3 V using Miniprog3 Programmer. This Programmer kit can be purchased from Cypress Store using part# ‘CY8CKIT-002 - MiniProg3’. It is a small, compact programmer which connects PC via a USB 2.0 cable (provided along with CY8cKIT-002).

Note: MiniProg1 Programmer should not be used as it does not support programming at 3.3 V.

Ordering Information

The following table lists the CY7C89435 PSoC devices' key package features and ordering codes.

W	watt

Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase ‘h’ (for example, ‘14h’ or ‘3Ah’). Hexadecimal numbers may also be represented by a ‘0x’ prefix, the C coding convention. Binary numbers have an appended lowercase ‘b’ (for example, 01010100b’ or ‘01000011b’). Numbers not indicated by an ‘h’, ‘b’, or 0x are decimal.

Glossary

Crosspoint connection	Connection between any GPIO combination via analog multiplexer bus.
Differential non-linearity	Ideally, any two adjacent digital codes correspond to output analog voltages that are exactly one LSB apart. Differential non-linearity is a measure of the worst case deviation from the ideal 1 LSB step.
Hold time	Hold time is the time following a clock event during which the data input to a latch or flip-flop must remain stable in order to guarantee that the latched data is correct.
I^2C	It is a serial multi-master bus used to connect low speed peripherals to MCU.
Integral nonlinearity	It is a term describing the maximum deviation between the ideal output of a DAC/ADC and the actual output level.
Latch-up current	Current at which the latch-up test is conducted according to JESD78 standard (at 125 degree Celsius)
Power supply rejection ratio (PSRR)	The PSRR is defined as the ratio of the change in supply voltage to the corresponding change in output voltage of the device.
Scan	The conversion of all sensor capacitances to digital values.
Setup time	Period required to prepare a device, machine, process, or system for it to be ready to function.
Signal-to-noise ratio	The ratio between a capacitive finger signal and system noise.
SPI	Serial peripheral interface is a synchronous serial data link standard.

Document Title: CYRF89435, PRoC™ - CapSense® Document Number: 001-76581				
Revision	**ECN**	**Orig. of Change**	**Submission Date**	**Description of Change**
**	3545779	ANTG	03/13/2012	New silicon document
*A	3591949	ANTG	05/14/2012	Updated Document Title to read as “PRoC™ - CapSense®”. Updated status “Company Confidential” of the datasheet. Changed “PRoC NL - CapSense” to “PRoC-CS” everywhere in the datasheet. Updated the Electrical Specifications. Updated the RF specifications.
*B	3714928	AKHL	08/16/2012	Major text update. Updated the pinout (Figure 3).
*C	3747532	AKHL	09/25/2012	Removed “Company Confidential” tag in the header. Replaced package diagram spec with 001-13190.
*D	3784571	AKHL	10/18/2012	Updated PSoC® Functional Overview (Added Transmit Power Control). Updated Electrical Specifications – RF Section (Replaced CYRF8935 with CYRF89435 in Figure 12 and also in the last bullet point below Figure 13). Updated Development Tool Selection (Updated Evaluation Tools (Removed “CY8CKIT-002 - MiniProg 3”), updated Device Programmers (Removed “CY3207ISSP In-System Serial Programmer (ISSP)”, added the content from the removed section “CY8CKIT-002 - MiniProg 3” with slight modification). Updated to new template.
*E	3982770	AKHL	05/15/2013	Updated PRoC-CS Features. Updated Logical Block Diagram. Updated PSoC® Functional Overview: Updated WirelessUSB-NL System (Updated Figure 2). Updated Transmit Power Control (Updated Table 1). Removed “Development Kits”. Removed “Training”. Updated Electrical Specifications – PSoC Core: Updated Absolute Maximum Ratings (Updated Table 2). Updated Operating Temperature (Updated Table 3). Updated Electrical Specifications – RF Section: Updated SPI Timing Requirements (Updated Table 25). Updated Packaging Information: No change in Package Diagram revision. Updated Capacitance on Crystal Pins (Updated Table 27). Updated Solder Reflow Specifications (Updated Table 28). Updated Development Tool Selection: Removed “Evaluation Tools”. Removed “Accessories (Emulation and Programming)”. Removed “Third Party Tools”. Updated Ordering Information: No change in part numbers. Added Ordering Code Definitions.
*F	4708265	CSAI	03/31/2015	Updated to new template. Completing Sunset Review.
*G	5741591	SGUP	05/18/2017	Added watermark “Not recommended for new designs” across the document. Updated Packaging Information: spec 001-13190 – Changed revision from *H to *I. Updated to new template.
