## ABSOLUTE MAXIMUM RATINGS

V<sub>CC</sub>, SDA, SCL ..... -0.3V to +6.0V  
 All Other Pins ..... -0.3V to V<sub>CC</sub> +0.3V  
 SDA, ALERT, OVERT Current ..... -1mA to +50mA  
 ESD Protection (Human Body Model) ..... 2000V  
 Continuous Power Dissipation (T<sub>A</sub> = +70°C)  
   8-Pin SO (derate 5.88mW/°C above +70°C) ..... 471mW

Junction Temperature ..... +150°C  
 Operating Temperature Range ..... -55°C to +150°C  
 Storage Temperature Range ..... -65°C to +150°C  
 Lead Temperature (soldering, 10s) ..... +300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = +3.0V to +5.5V, T<sub>A</sub> = -55°C to +125°C, unless otherwise noted. Typical values are V<sub>CC</sub> = +3.3V, T<sub>A</sub> = +25°C, unless otherwise noted.)

## Detailed Description

The MAX6633/MAX6634/MAX6635 continuously convert their die temperatures into digital values using their integrated ADCs. The resulting data is readable at any time through the SMBus/I<sup>2</sup>C-compatible serial interface. The device functions as a slave on the SMBus interface, supporting Write Byte, Write Word, Read Byte, and Read Word commands. Separate addresses can be configured using the individual address pins. Figures 5, 6, and 7 show the functional diagrams of the MAX6633/MAX6634/MAX6635, respectively.

### SMBus/I<sup>2</sup>C-Compatible Operation

The MAX6633/MAX6634/MAX6635 are readable and programmable through their SMBus/I<sup>2</sup>C-compatible serial interface. Figures 1, 2, and 3 show the timing details of the clock (SCL) and data (SDA) signals. The devices function as slaves on the SMBus and support Write Byte, Write Word, Read Byte, and Read Word commands. Figure 8 is the MAX6633/MAX6634/MAX6635 programmer's model.

### Addressing

Separate addresses can be configured using the individual address pins. The address of each device is selected by connecting the address (A<sub>n</sub>) pins to one of two potentials: GND or V<sub>CC</sub>. The MAX6635 makes two address pins available (A0, A1), allowing up to four devices to be connected to a single bus line. The MAX6634 makes three address pins available (A0, A1, A2), allowing up to eight devices to be connected to a single bus line. The MAX6633 makes four address pins available (A0, A1, A2, A3), allowing as many as 16

devices to be connected to a single bus line. Table 1 shows the full SMBus/I<sup>2</sup>C address for each device type.

### Control Registers (MAX6633)

Three registers control the operation of the MAX6633 (Figure 5 and Tables 2 through 6). The Pointer register is the first addressed and determines which of the other two registers is acted upon. The other two are the Temperature and Configuration registers. The temperature value is stored as 12 bits plus a sign bit, read only, and contains the latest temperature data. The true register length is 16 bits, with the lower 3 unused in this part. The digital temperature data contained in the temperature register is in °C, using a two's-complement format with 1LSB corresponding to 0.0625°C.

The Configuration register is 8 bits, read/write, and contains the SMBus timeout disable bit, fault queue enable bit, and the shutdown bit.

### Control Registers (MAX6634)

Six registers control the operation of the MAX6634 (Figure 6 and Tables 2 through 7). The pointer register is the first addressed and determines which of the other five registers is acted upon. The other five are the Temperature, Configuration, High-Temperature (THIGH), Low-Temperature (TLOW), and Hysteresis (THYST) registers. The temperature value is stored as 12 bits plus a sign bit, read only, and contains the latest temperature data. The true register length is 16 bits, with the lowest 2 used as status bits, and the third bit (D2) is unused. The digital temperature data contained in the temperature register is in °C, using a two's-complement format with 1LSB corresponding to 0.0625°C.

Figure 1. SMBus Protocols

Figure 2. SMBus Write Timing Diagram

# 12-Bit Plus Sign Temperature Sensors with SMBus/I<sup>2</sup>C-Compatible Serial Interface

Figure 3. SMBus Read Timing Diagram

Figure 4. ADC Conversion Timing Diagram

The Configuration register is 8 bits, read/write, and contains the SMBus timeout disable bit, fault queue enable bit, the temperature alarm output polarity select bits, the interrupt mode select bit, and the shutdown bit. Registers  $T_{HIGH}$  and  $T_{LOW}$  are 16 bits, read/write, and contain the values that trigger ALERT. Register  $T_{HYST}$  is 16 bits, read/write, and contains the values by which the temperature must rise or fall beyond  $T_{HIGH}$  or  $T_{LOW}$ , before ALERT deasserts.

## Control Registers (MAX6635)

Seven registers control the operation of the MAX6635 (Figure 7 and Tables 2 through 7). The Pointer register is the first addressed and determines which of the other six registers is acted upon. The other six are the Temperature, Configuration, High-Temperature ( $T_{HIGH}$ ), Low-Temperature ( $T_{LOW}$ ), Maximum Temperature ( $T_{MAX}$ ), and Hysteresis ( $T_{HYST}$ ) registers. The temperature value is stored as 12 bits plus a sign bit, read only, and contains the latest temperature data. The true register length is 16 bits, with the lower three used as status bits. The digital temperature data contained in the temperature register is in  $^{\circ}\text{C}$ , using a two's-complement format with 1LSB corresponding to  $0.0625^{\circ}\text{C}$ .

The Configuration register is 8 bits, read/write, and contains the SMBus timeout disable bit, fault queue enable bit, the temperature alarm output polarity select bits, the interrupt mode select bit, and the shutdown

# 12-Bit Plus Sign Temperature Sensors with SMBus/I<sup>2</sup>C-Compatible Serial Interface

Figure 9. Alarm Output and Reset Diagram

bit. Registers  $T_{\text{HIGH}}$  and  $T_{\text{LOW}}$  are 16 bits, read/write, and contain values that trigger  $\overline{\text{ALERT}}$  and  $\overline{\text{OVERT}}$ . Register  $T_{\text{HYST}}$  is 16 bits, read/write, and contains the values by which the temperature must rise or fall beyond  $T_{\text{HIGH}}$ ,  $T_{\text{LOW}}$ , or  $T_{\text{MAX}}$ , before  $\overline{\text{ALERT}}$  or  $\overline{\text{OVERT}}$  deassert.

## Temperature Conversion

An on-chip bandgap reference produces a signal proportional to absolute temperature (PTAT), as well as the temperature-stable reference voltage necessary for the analog-to-digital conversion. The PTAT signal is digitized by the on-board ADC to a resolution of 0.0625°C. The resulting digital value is placed in the Temperature register. The temperature conversion runs continuously and asynchronously from the serial interface at a rate of 500ms per conversion. When the Temperature register is read, the conversion in progress is aborted. The bus transaction is completed by a stop condition.

## Fault Queue (MAX6634/MAX6635)

A programmable fault queue on the MAX6634/MAX6635 eliminates spurious alarm activity in noisy environments. The queue sets the number of consecutive out-of-tolerance temperature readings that must occur before the  $\overline{\text{ALERT}}$  or  $\overline{\text{OVERT}}$  alarm outputs are toggled. An out-of-tolerance reading is above  $T_{\text{HIGH}}$  or  $T_{\text{MAX}}$  or below  $T_{\text{LOW}}$ . The fault queue depth defaults to 1 at power-up and may be programmed—through the Configuration register—to four consecutive conversions. Any time the conversion result is in tolerance, and the particular alarm output is not asserted, the queue is cleared, even if it contains some out-of-tolerance counts. Additionally, the fault queue automatically clears at power-up and in shutdown. Whenever the fault queue is cleared, the alarm outputs are deasserted. Figure 9 is the alarm output and reset diagram.

# 12-Bit Plus Sign Temperature Sensors with SMBus/I<sup>2</sup>C-Compatible Serial Interface

MAX6633/MAX6634/MAX6635

Figure 10. Simple Thermostat

## Temperature Alert (MAX6634/MAX6635)

$\overline{\text{ALERT}}$  has programmable polarity and two modes: comparator and interrupt. Polarity and mode are selected through the Configuration register (Table 4). The  $\overline{\text{ALERT}}$  output is open drain.

### Interrupt Mode

With  $\overline{\text{ALERT}}$  in interrupt mode, the MAX6634/MAX6635 look for a  $T_{\text{HIGH}}$  or a  $T_{\text{LOW}}$  fault. The  $\overline{\text{ALERT}}$  pin asserts an alarm for an undertemperature fault, as well as for an overtemperature fault. Once either fault has occurred, it remains active until deasserted by a read of any register. The device then begins to look for a temperature change crossing the hysteresis level. The activation of  $\overline{\text{ALERT}}$  is subject to the depth of the fault queue.

For example: If  $T_{\text{HIGH}}$  is set to 100°C,  $T_{\text{HYST}}$  is set to 20°C, and the fault queue depth is set to 4,  $\overline{\text{ALERT}}$  does not assert until four consecutive conversions exceed 100°C. If the temperature is then read through the I<sup>2</sup>C-compatible interface,  $\overline{\text{ALERT}}$  deasserts.  $\overline{\text{ALERT}}$  asserts again when four consecutive conversions are less than 80°C.

### Comparator Mode

In comparator mode,  $\overline{\text{ALERT}}$  is asserted when the number of consecutive conversions exceeding the value in the  $T_{\text{HIGH}}$  register, or lower than the value in the  $T_{\text{LOW}}$  register, is equal to the depth of the fault queue.  $\overline{\text{ALERT}}$  deasserts when the number of consecutive conversions

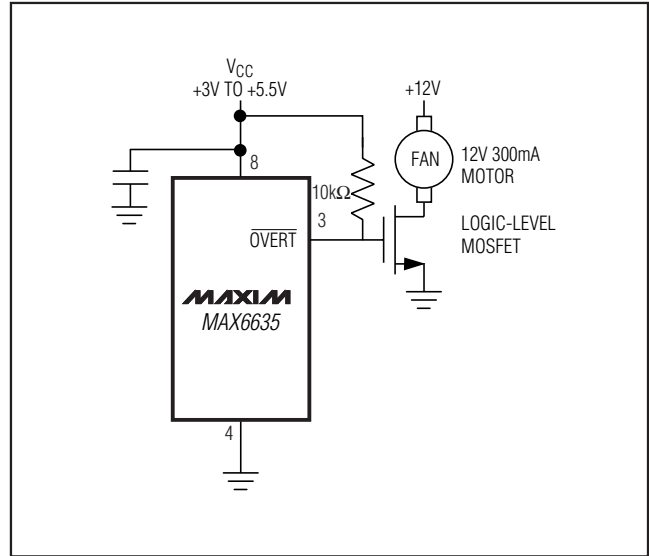

Figure 11. Fan Controller

less than  $T_{\text{HIGH}} - T_{\text{HYST}}$  or greater than  $T_{\text{LOW}} + T_{\text{HYST}}$  is equal to the depth of the fault queue.

For example: If  $T_{\text{HIGH}}$  is set to 100°C,  $T_{\text{LOW}}$  is set to 80°C, and the fault queue depth is set to four,  $\overline{\text{ALERT}}$  does not assert until four consecutive conversions exceed 100°C, or are below 80°C.  $\overline{\text{ALERT}}$  only deasserts if four consecutive conversions are less than  $T_{\text{HIGH}} - T_{\text{HYST}}$  or greater than  $T_{\text{LOW}} + T_{\text{HYST}}$ .

Comparator mode allows autonomous clearing of an  $\overline{\text{ALERT}}$  fault without the intervention of a master and is ideal to use for driving a thermostat (Figure 10).

## Overtemperature Alarm (MAX6635)

The MAX6635 also includes an overtemperature output that is always in comparator mode. Whenever the temperature exceeds a value in the programmable  $T_{\text{MAX}}$  register,  $\overline{\text{OVERT}}$  is asserted.  $\overline{\text{OVERT}}$  only deasserts after the temperature drops below  $T_{\text{MAX}} - T_{\text{HYST}}$ . When the fault queue is activated,  $\overline{\text{OVERT}}$  is subject to that queue, which sets the number of faults that must occur before  $\overline{\text{OVERT}}$  asserts or deasserts. This helps prevent spurious alarms in noisy environments.

Comparator mode also allows autonomous clearing of an  $\overline{\text{OVERT}}$  fault without the intervention of a master and thus is ideal to use for driving a cooling fan (Figure 11). In this application, the polarity of  $\overline{\text{OVERT}}$  is active high.

## Shutdown

The MAX6633/MAX6634/MAX6635 feature a shutdown mode, accessible through the serial interface that saves power by turning off everything except the POR

# 12-Bit Plus Sign Temperature Sensors with SMBus/I<sup>2</sup>C-Compatible Serial Interface

and the serial interface. Enter shutdown by programming the shutdown bit of the Configuration register high. While in shutdown, the Temperature register retains the last conversion result and can be read at any time. The ADC is turned off, reducing the device current draw to 30μA (max). The outputs of  $\overline{\text{ALERT}}$  and  $\overline{\text{OVERT}}$  are latched upon entering shutdown, and the fault queue is held in reset. After coming out of shutdown, the Temperature register continues to read the last converted temperature, until the next conversion result is available.

## Thermal Considerations

The MAX6633/MAX6634/MAX6635 supply current is typically 200μA when the serial interface is inactive. When used to drive high-impedance loads, the devices dissipate negligible power; therefore, the die temperature is essentially the same as the package temperature. The key to accurate temperature monitoring is good thermal contact between the MAX6633/MAX6634/MAX6635 package and the monitored device or circuit. Heat flows in and out of plastic packages primarily through the leads. Short, wide copper traces leading to the temperature monitor ensure that heat transfers quickly and reliably. The rise in die temperature due to self-heating is given by the following formula:

$$\Delta T_J = P_{\text{DISSIPATION}} \times \theta_{JA}$$

where  $P_{\text{DISSIPATION}}$  is the power dissipated by the MAX6633/MAX6634/MAX6635, and  $\theta_{JA}$  is the package's thermal resistance.

The typical thermal resistance is 170°C/W for the 8-pin SO package. To limit the effects of self-heating, minimize the output currents. For example, if the MAX6634/MAX6635 sink 4mA with the maximum  $\overline{\text{ALERT}}$   $V_L$  specification of 0.8V, an additional 3.2mW of power is dissipated within the IC. This corresponds to a 0.54°C rise in the die temperature.

## Applications Information

Figure 10 shows the MAX6634 used as a simple thermostat to control a heating element. Figure 11 shows the MAX6635 used as a temperature-triggered fan controller.

### NOTES:

1. D&E DO NOT INCLUDE MOLD FLASH.
2. MOLD FLASH OR PROTRUSIONS NOT TO EXCEED 0.15mm (.006").
3. LEADS TO BE COPLANAR WITHIN 0.10mm (.004").
4. CONTROLLING DIMENSION: MILLIMETERS.
5. MEETS JEDEC MS012.
6. N = NUMBER OF PINS.

DIM	INCHES		MILLIMETERS	
	MIN	MAX	MIN	MAX
A	0.053	0.069	1.35	1.75
A1	0.004	0.010	0.10	0.25
B	0.014	0.019	0.35	0.49
C	0.007	0.010	0.19	0.25
e	0.050 BSC		1.27 BSC	
E	0.150	0.157	3.80	4.00
H	0.228	0.244	5.80	6.20
L	0.016	0.050	0.40	1.27

### VARIATIONS:

DIM	INCHES		MILLIMETERS		N	MS012
	MIN	MAX	MIN	MAX		
D	0.189	0.197	4.80	5.00	8	AA
D	0.337	0.344	8.55	8.75	14	AB
D	0.386	0.394	9.80	10.00	16	AC
