# MTD6501C/D/G

Functional Block Diagram

© 2010-2012 Microchip Technology Inc.

Typical Application – Fan Motor Driver Using the MTD6501C or MTD6501G

Recommended External Components for Typical Application

Element	Type/Value	Comment
C_1	$\geq$1 µF	Connect as close as possible to IC input pins
C_2	$\geq$1 µF	Connect as close as possible to IC input pins
R_1	$\geq$10 kΩ	Connect to V_{logic} on controller side

Typical Application – Fan Motor Driver Using the MTD6501D

Recommended External Components for Typical Application

Element	Type/Value	Comment
C1	≥ 1 µF	Connect as close as possible to IC input pins
C2	≥ 1 µF	Connect as close as possible to IC input pins
R1	≥ 10 kΩ	Connect to Vlogic on controller side

Absolute Maximum Ratings†

Power Supply Voltage (V_{CC_MAX}) .... -0.7 to +15.3V
Maximum OUT1, 2, 3 Output Voltage (V_{OUT_MAX}) ....
.... -0.7 to +15.3V+0.7V
FG Maximum Output Voltage (V_{FG_MAX}) .... -0.7 to +15.3V
Maximum Output Current[3,4] (I_{OUT_MAX}).....................800 mA
Maximum Output Current[3,5] (I_{OUT_MAX}).....................500 mA
FG Maximum Output Voltage (V_{FG_MAX}) .... -0.7 to +15.3V
FG Maximum Output Current (I_{FG_MAX}) ....5.0 mA
V_{DD} Maximum Voltage (V_{DD_MAX}) .... -0.7 to +4.0V
PWM Maximum Voltage (V_{PWM_MAX}) .... -0.7 to +4.0V
Allowable Power Dissipation[1,2,4] (P_{D_MAX}).....................1.0W
Allowable Power Dissipation[1,2,5] (P_{D_MAX}).....................0.5W
Max Junction Temperature (T_J)...................................+150°C

† **Notice:** Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Note 1: Reference PCB, according to JEDEC standard EIA/JESD 51-9.

2: Derating applies for ambient temperatures outside the specified operating range (refer to Figure 1-1).

3: OUT1, OUT2, OUT3 (Continuous, 100% duty cycle).

4: MTD6501C and MTD6501G

5: MTD6501D

ELECTRICAL CHARACTERISTICS

Electrical Specifications: Unless otherwise specified, all limits are established for V_{CC} = 5.0V, T_A = +25°C

2.0   PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

TABLE 2-1:   MTD6501C/D/G PIN FUNCTION TABLE

MTD6501C, MTD6501G	MTD6501D	Type	Symbol	Description
SOP-8	MSOP			
1	1	O	FG	Motor speed indication output
2	3	P	V_{DD}	Internal regulator output (for decoupling only)
3	4	O	OUT1	Single-phase coil output pin
4	5	O	OUT2	Single-phase coil output pin
5	2, 6	P	GND	Negative voltage supply (ground)
6	7	O	OUT3	Single-phase coil output pin
7	8	P	V_{CC}	Positive voltage supply for motor driver
8	10	I	PWM	PWM input signal for speed control
N/A	9	I	BOOST	Boost mode selection: • Pin floating for Normal mode • Pin tied to GND for Boost mode

Legend: I = Input; O = Output; P = Power

NOTES:

3.0 FUNCTIONAL DESCRIPTION

The MTD6501C/D/G devices generate a full-wave signal to drive a 3-phase sensorless BLDC motor. High efficiency and low-power consumption are achieved due to DMOS transistors and synchronous rectification drive type. The current carrying order of the output is as follows: OUT1 → OUT2 → OUT3.

3.1 Speed Control

The rotational speed of the motor can be controlled either through the PWM digital input signal or by acting directly on the power supply (V_{CC}). When the PWM signal is "High" (or left open) the motor rotates at full speed. When the PWM signal is "Low", the motor is stopped (and the IC outputs are set to high-impedance). By changing the PWM duty cycle, the speed can be adjusted. Notice that the PWM frequency has no special meaning for the motor speed and is asynchronous with the activation of the output transistors. Thus, the user has maximum freedom to choose the PWM system frequency within a wide range (from 20 Hz to 100 kHz), while the output transistor activation always occurs at a fixed rate, which is outside of the range of audible frequencies. The MTD6501C and MTD6501D typical output frequency is 20 kHz. The MTD6501G output frequency is 23 kHz.

3.2 Frequency Generator Function

The Frequency Generator output is a "Hall-sensor equivalent" digital output, giving information to an external controller about the speed and phase of the motor. The FG pin is an open drain output, connecting to a logical voltage level through an external pull-up resistor. When a lock (or out-of-sync) situation is detected by the driver, this output is set to high-impedance until the motor is restarted. Leave the pin open when not used. The FG signal can be used to compute the motor speed in rotations per minute (RPM). Typically, for a four pole BLDC fan, the speed in RPMs is 30 FG frequency (Hz).

3.3 Lockup Protection and Automatic Restart

If the motor is stopped (blocked) or if it loses synchronization with the driver, a lock-up protection circuit detects this situation and disables the driver (by setting its outputs to high-impedance) in order to prevent the motor coil from burnout. After a "waiting time" (T_{WAIT}), the lock-up protection is released and normal operation resumes for a given time (T_{RUN}). In case the motor is still blocked, a new period of waiting time is started. T_{WAIT} and T_{RUN} timings are fixed internally, so that no external capacitor is needed.

3.4 Overcurrent Protection and Short Circuit Detection

The motor peak current is limited by the driver to a fixed value (defined internally), thus limiting the maximum power dissipation in the coils. The detection of a short-circuit situation immediately sets the driver outputs to high-impedance, in order to avoid permanent damage to the IC.

3.5 Thermal Shutdown

The MTD6501C/D/G have a thermal protection function which detects when the die temperature exceeds T_{SD} = +170°C. When this temperature is reached, the circuit enters Thermal Shutdown mode and the outputs OUT1, OUT2 and OUT3 are disabled (high-impedance), avoiding IC destruction and allowing the circuit to cool down. Once the junction temperature (T_{SD}) has dropped below +145°C, the normal operation resumes (thermal detection circuit has +25°C hysteresis function).

FIGURE 3-1: *Thermal Protection Hysteresis.*

3.6 Internal Voltage Regulator

V_{DD} voltage is generated internally and is used to supply internal logical blocks. The V_{DD} pin is used to connect an external decoupling capacitor (1 µF or higher). Notice that this pin is for IC internal use and is not designed to supply DC current to external blocks.

3.7 Boost Mode (MTD6501D)

The Boost mode is an optional BEMF pre-amplification by a factor of three. The intention of Boost mode is to compensate for motors with a low coupling coefficient (= BEMF coefficient), thus allowing it to cover an even wider range of motor characteristics. Notice that Boost mode impacts the mechanical performance of the motor altogether. In Boost mode, the speed of the motor will adjust faster to variations of the control (V_{CC} or PWM) and/or of the load, including at start-up. However, when the BEMF is amplified too much, the mechanical performance (in terms of vibration and acoustic noise) may start degrading. Thus, Boost mode may be inappropriate for motors that already have a good coupling coefficient. The optimum choice between normal mode and Boost mode depends both on the application requirements and on the motor characteristics.

Refer to Table 3-1 for usage of Boost pin 9; leaving this pin floating results in the normal mode of operation, while tying this pin to GND activates Boost mode (active low feature, internal pull-up).

TABLE 3-1: POSSIBLE MODES OF OPERATION BASED ON THE BOOST PIN CONNECTION

BOOST Pin	Mode of Operation
Floating	Normal
Tied to GND	Boost

4.0 PACKAGING INFORMATION

NOTES:

APPENDIX A: REVISION HISTORY

Revision B (May 2012)

The following is the list of modifications:

1. Added the MTD6501G device to the family and related information throughout the document.
2. Updated the **Temperature Specifications** table.
3. Sorted the information in Table 2-1.
4. Corrected Frequency Generator output to open drain in **Section 3.2 "Frequency Generator Function"**.
5. Renamed **Section 4.0 "Packaging Information"**. Added **Section 4.1 "Package Marking Information"**.
6. Added **Product Identification System** section.
7. Other minor typographical corrections.

Revision A (September 2010)

• Original data sheet for the MTD6501C/D/G family of devices.

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

NOTES:

Note the following details of the code protection feature on Microchip devices:

• Microchip products meet the specification contained in their particular Microchip Data Sheet.

• Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.

• There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

• Microchip is willing to work with the customer who is concerned about the integrity of their code.

• Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Trademarks

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
