

devices are designed to drive 12 V automotive grounded loads through a 3 V and 5 V CMOS-compatible interface, and to provide protection and diagnostics.

The devices integrate advanced protective functions such as load current limitation, overload active management by power limitation and overtemperature shutdown with configurable latch-off.

A $\overline{\text{FaultRST}}$ pin unlatches the output in case of fault or disables the latch-off functionality.

A dedicated multifunction multiplexed analog output pin delivers sophisticated diagnostic functions including high precision proportional load current sense, supply voltage feedback and chip temperature sense, in addition to the detection of overload and short circuit to ground, short to V_{CC} and OFF-state open-load.

A sense enable pin allows OFF-state diagnosis to be disabled during the module low-power mode as well as external sense resistor sharing among similar devices.

1 Block diagram and pin description

Figure 1. Block diagram

Table 1. Pin functions

Name	Function
V _{CC}	Battery connection.
OUTPUT	Power outputs.
GND	Ground connection. Must be reverse battery protected by an external diode / resistor network.
INPUT	Voltage controlled input pin with hysteresis, compatible with 3 V and 5 V CMOS outputs. It controls output switch state.
MultiSense	Multiplexed analog sense output pin; it delivers a current proportional to the selected diagnostic: load current, supply voltage or chip temperature.
SEn	Active high compatible with 3 V and 5 V CMOS outputs pin; it enables the MultiSense diagnostic pin.
SEL _{0,1}	Active high compatible with 3 V and 5 V CMOS outputs pin; they address the MultiSense multiplexer.
$\overline{\text{FaultRST}}$	Active low compatible with 3 V and 5 V CMOS outputs pin; it unlatches the output in case of fault; If kept low, sets the outputs in auto-restart mode.

Figure 2. Configuration diagram (top view)

GAPG2601151129CFT

Table 2. Suggested connections for unused and not connected pins

Connection / pin	MultiSense	N.C.	Output	Input	SEn, SELx, FaultRST
Floating	Not allowed	X ⁽¹⁾	X	X	X
To ground	Through 1 kΩ resistor	X	Not allowed	Through 15 kΩ resistor	Through 15 kΩ resistor

1. X: do not care.

2 Electrical specification

Figure 3. Current and voltage conventions

GADG2203170950PS

Note: $V_F = V_{OUT} - V_{CC}$ during reverse battery condition.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 3. Absolute maximum ratings](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in table below for extended periods may affect device reliability.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	DC supply voltage	38	V
$-V_{CC}$	Reverse DC supply voltage	0.3	
V_{CCPK}	Maximum transient supply voltage (ISO 16750-2:2010 Test B clamped to 40 V; $R_L = 4 \Omega$)	40	V
V_{CCJS}	Maximum jump start voltage for single pulse short-circuit protection	28	V
$-I_{GND}$	DC reverse ground pin current	200	mA
I_{OUT}	OUTPUT DC output current	Internally limited	A
$-I_{OUT}$	Reverse DC output current	11	
I_{IN}	INPUT DC input current	-1 to 10	mA
I_{SEn}	SEn DC input current		
I_{SEL}	SEL _{0,1} DC input current		
I_{FR}	FaultRST DC input current		
V_{FR}	FaultRST DC input voltage	7.5	V
I_{SENSE}	MultiSense pin DC output current ($V_{GND} = V_{CC}$ and $V_{SENSE} < 0$ V)	10	mA
	MultiSense pin DC output current in reverse ($V_{CC} < 0$ V)	-20	
E_{MAX}	Maximum switching energy (single pulse) ($T_{DEMAG} = 0.4$ ms; $T_{jstart} = 150$ °C)	36	mJ

Symbol	Parameter	Value	Unit
V_{ESD}	Electrostatic discharge (JEDEC 22A-114F)	4000	V
	• INPUT	2000	V
	• MultiSense	4000	V
	• SEn, SEL _{0,1} , FaultRST	4000	V
	• OUTPUT	4000	V
	• V _{CC}	4000	V
V_{ESD}	Charge device model (CDM-AEC-Q100-011)	750	V
T_j	Junction operating temperature	-40 to 150	°C
T_{stg}	Storage temperature	-55 to 150	

2.2 Thermal data

Table 4. Thermal data

Symbol	Parameter	Typ. value		Unit
		SO-8	PowerSSO-16	
$R_{thj-board}$	Thermal resistance junction-board (JEDEC JESD 51-8) ⁽¹⁾	29	6.2	°C/W
$R_{thj-amb}$	Thermal resistance junction-ambient (JEDEC JESD 51-2) ⁽²⁾	67	57	
$R_{thj-amb}$	Thermal resistance junction-ambient (JEDEC JESD 51-2)	45	23.5	

1. Device mounted on four-layers 2s2p PCB

2. Device mounted on two-layers 2s0p PCB with 2 cm² heatsink copper trace

2.3 Main electrical characteristics

7 V < V_{CC} < 28 V; -40°C < T_j < 150°C, unless otherwise specified.

All typical values refer to V_{CC} = 13 V; T_j = 25°C, unless otherwise specified.

Table 5. Power section

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V _{CC}	Operating supply voltage		4	13	28	V
V _{USD}	Undervoltage shutdown				4	V
V _{USDReset}	Undervoltage shutdown reset				5	V
V _{USDhyst}	Undervoltage shutdown hysteresis			0.3		V
R _{ON}	On-state resistance	I _{OUT} = 2.5 A; T _j = 25°C		40		mΩ
		I _{OUT} = 2.5 A; T _j = 150°C			80	
		I _{OUT} = 2.5 A; V _{CC} = 4 V; T _j = 25°C			60	
V _{clamp}	Clamp voltage	I _S = 20 mA; 25°C < T _j < 150°C	41	46	52	V
		I _S = 20 mA; T _j = -40°C	38			V

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit

3 Protections

3.1 Power limitation

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing ΔT_j through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as ΔT_j exceeds the safety level of ΔT_{j_SD} . According to the voltage level on the FaultRST pin, the output MOSFET switches on and cycles with a thermal hysteresis according to the maximum instantaneous power which can be handled (FaultRST = Low) or remains off (FaultRST = High). The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue.

3.2 Thermal shutdown

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175°C), it automatically switches off and the diagnostic indication is triggered. According to the voltage level on the FaultRST pin, the device switches on again as soon as its junction temperature drops to T_R (FaultRST = Low) or remains off (FaultRST = High).

3.3 Current limitation

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (e.g. bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. Consequently, in case of short circuit, overload or during load power-up, the output current is clamped to a safety level, I_{LIMH} , by operating the output power MOSFET in the active region.

3.4 Negative voltage clamp

In case the device drives inductive load, the output voltage reaches a negative value during turn off. A negative voltage clamp structure limits the maximum negative voltage to a certain value, V_{DEMAG} , allowing the inductor energy to be dissipated without damaging the device.

4 Application information

Figure 35. Application diagram

GAPG0810141031CFT

4.1 GND protection network against reverse battery

Figure 36. Simplified internal structure

GAPGCFT00809

4.1.1 Diode (DGND) in the ground line

A resistor (typ. $R_{GND} = 4.7 \text{ k}\Omega$) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift ($\approx 600 \text{ mV}$) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift does not vary if more than one HSD shares the same diode/resistor network.

4.2 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the V_{CC} pin, is tested in accordance with ISO7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in [Table 12. ISO 7637-2 - electrical transient conduction along supply line](#).

Test pulses are applied directly to DUT (Device Under Test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), chapter 4. The DUT is intended as the present device only, without components and accessed through V_{CC} and GND terminals.

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: "The function does not perform as designed during the test but returns automatically to normal operation after the test".

Table 12. ISO 7637-2 - electrical transient conduction along supply line

Test Pulse 2011(E)	Test pulse severity level with Status II functional performance status		Minimum number of pulses or test time	Burst cycle / pulse repetition time		Pulse duration and pulse generator internal impedance
	Level	$U_S^{(1)}$		min	max	
1	III	-112 V	500 pulses	0.5 s		2 ms, 10 Ω
2a	III	+55 V	500 pulses	0.2 s	5 s	50 μs , 2 Ω
3a	IV	-220 V	1h	90 ms	100 ms	0.1 μs , 50 Ω
3b	IV	+150 V	1h	90 ms	100 ms	0.1 μs , 50 Ω
4 ⁽²⁾	IV	-7 V	1 pulse			100 ms, 0.01 Ω
Load dump according to ISO 16750-2:2010						
Test B ⁽³⁾		40 V	5 pulse	1 min		400 ms, 2 Ω

1. U_S is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E), chapter 5.6.

2. Test pulse from ISO 7637-2:2004(E).

3. With 40 V external suppressor referred to ground ($-40^\circ\text{C} < T_J < 150^\circ\text{C}$).

4.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line both to prevent the microcontroller I/O pins from latching-up and to protect the HSD inputs.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of microcontroller I/Os.

Equation

$$V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -150 \text{ V}$; $I_{latchup} \geq 20 \text{ mA}$; $V_{OH\mu C} \geq 4.5 \text{ V}$

$7.5 \text{ k}\Omega \leq R_{prot} \leq 140 \text{ k}\Omega$.

Recommended values: $R_{\text{prot}} = 15 \text{ k}\Omega$

4.4 Multisense - analog current sense

Diagnostic information on device and load status are provided by an analog output pin (MultiSense) delivering the following signals:

- Current monitor: current mirror of channel output current
- V_{CC} monitor: voltage proportional to V_{CC}
- T_{CASE} : voltage proportional to chip temperature

Those signals are routed through an analog multiplexer which is configured and controlled by means of SELx and SEn pins, according to the address map in *MultiSense multiplexer addressing Table*.

Figure 37. MultiSense and diagnostic – block diagram

GADG2004171456PS

4.4.1 Principle of Multisense signal generation

Figure 38. MultiSense block diagram

Current monitor

When current mode is selected in the MultiSense, this output is capable to provide:

- Current mirror proportional to the load current in normal operation, delivering current proportional to the load according to known ratio named **K**
- Diagnostics flag in fault conditions delivering fixed voltage V_{SENSEH}

The current delivered by the current sense circuit, I_{SENSE} , can be easily converted to a voltage V_{SENSE} by using an external sense resistor, R_{SENSE} , allowing continuous load monitoring and abnormal condition detection.

Normal operation (channel ON, no fault, SEn active)

While device is operating in normal conditions (no fault intervention), V_{SENSE} calculation can be done using simple equations

Current provided by MultiSense output: $I_{SENSE} = I_{OUT}/K$

Voltage on R_{SENSE} : $V_{SENSE} = R_{SENSE} \cdot I_{SENSE} = R_{SENSE} \cdot I_{OUT}/K$

Where:

- V_{SENSE} is voltage measurable on R_{SENSE} resistor
- I_{SENSE} is current provided from MultiSense pin in current output mode
- I_{OUT} is current flowing through output

- K factor represents the ratio between PowerMOS cells and SenseMOS cells; its spread includes geometric factor spread, current sense amplifier offset and process parameters spread of overall circuitry specifying ratio between I_{OUT} and I_{SENSE} .

Failure flag indication

In case of power limitation/overtemperature, the fault is indicated by the MultiSense pin which is switched to a “current limited” voltage source, V_{SENSEH} .

In any case, the current sourced by the MultiSense in this condition is limited to I_{SENSEH} .

The typical behavior in case of overload or hard short circuit is shown in *Waveforms* section.

Figure 39. Analogue HSD – open-load detection in off-state

Figure 40. Open-load / short to V_{CC} condition

Table 13. MultiSense pin levels in off-state

Condition	Output	MultiSense	SEn
Open-load	$V_{OUT} > V_{OL}$	Hi-Z	L
		V_{SENSEH}	H
	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H
Short to V_{CC}	$V_{OUT} > V_{OL}$	Hi-Z	L
		V_{SENSEH}	H
Nominal	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H

4.4.2 TCASE and VCC monitor

In this case, MultiSense output operates in voltage mode and output level is referred to device GND. Care must be taken in case a GND network protection is used, because a voltage shift is generated between the device GND and the microcontroller input GND reference.

Figure 41. GND voltage shift shows the link between $V_{MEASURED}$ and the real V_{SENSE} signal.

Figure 41. GND voltage shift

GAPGCFT01136

V_{CC} monitor

Battery monitoring channel provides $V_{SENSE} = V_{CC} / 4$.

Case temperature monitor

Case temperature monitor is capable of providing information about the actual device temperature. Since a diode is used for temperature sensing, the following equation describes the link between temperature and output V_{SENSE} level:

$$V_{\text{SENSE TC}}(T) = V_{\text{SENSE TC}}(T_0) + dV_{\text{SENSE TC}} / dT * (T - T_0)$$

where $dV_{\text{SENSE TC}} / dT \sim$ typically -5.5 mV/K (for temperature range $(-40^\circ\text{C}$ to $150^\circ\text{C})$).

4.4.3 Short to VCC and OFF-state open-load detection

Short to V_{CC}

A short circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off-state. Small or no current is delivered by the current sense during the on-state depending on the nature of the short circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU} .

It is preferable that V_{PU} is switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

R_{PU} must be selected in order to ensure $V_{OUT} > V_{OLmax}$ in accordance with the following equation:

Equation

$$R_{PU} < \frac{V_{PU} - 4}{I_{L(off2)min @ 4V}}$$

5 Maximum demagnetization energy (VCC = 16 V)

Figure 43. Maximum turn off current versus inductance

Note: Values are generated with $R_L = 0 \Omega$.

In case of repetitive pulses, T_{jstart} (at the beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

7.4 SO-8 packing information

Figure 59. Reel for SO-8

TAPG2004151655CFT

Table 22. Reel dimensions

Description	Value ⁽¹⁾
Base quantity	2500
Bulk quantity	2500
A (max)	330
B (min)	1.5
C (+0.5, -0.2)	13
D (min)	20.2
N	100
W1 (+2/-0)	12.4
W2 (max)	18.4

1. All dimensions are in mm.

Figure 60. SO-8 carrier tape

GAPG2105151447CFT

Table 23. SO-8 carrier tape dimensions

Description	Value ⁽¹⁾
A_0	6.50 ± 0.1
B_0	5.30 ± 0.1
K_0	2.20 ± 0.1
K_1	1.90 ± 0.1
F	5.50 ± 0.1
P_1	8.00 ± 0.1
W	12.00 ± 0.3

1. All dimensions are in mm.

7.5 PowerSSO-16 marking information

Figure 62. PowerSSO-16 marking information

GADG0310161234SMD

Parts marked as '&' are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

7.6 SO-8 marking information

Figure 63. SO-8 marking information

GAPG2705151558CFT

Note: *Engineering Samples: these samples can be clearly identified by a dedicated special symbol in the marking of each unit. These samples are intended to be used for electrical compatibility evaluation only; usage for any other purpose may be agreed only upon written authorization by ST. ST is not liable for any customer usage in production and/or in reliability qualification trials.*

Commercial Samples: fully qualified parts from ST standard production with no usage restrictions

8 Order codes

Table 24. Device summary

Package	Order codes
	Tape and reel
PowerSSO-16	VN7040AJTR
SO-8	VN7040ASTR

Revision history

Table 25. Document revision history

Date	Revision	Changes
04-Jun-2015	1	Initial release.
20-Jul-2015	2	Updated cover image. Updated <i>Table 4: "Thermal data"</i> Updated following sections: <i>Section 6.1: "PowerSSO-16 thermal data"</i> <i>Section 6.2: "SO-8 thermal data"</i>
02-Oct-2016	3	Updated the following: - Features list on the cover page <i>Figure 61: "PowerSSO-16 marking information"</i>
02-Jul-2018	4	Minor text changes in Section 4.4.2 T_{CASE} and V_{CC} monitor .

Contents

1	Block diagram and pin description	3
2	Electrical specification	5
2.1	Absolute maximum ratings	5
2.2	Thermal data	6
2.3	Main electrical characteristics	6
2.4	Waveforms	16
2.5	Electrical characteristics curves	18
3	Protections	23
3.1	Power limitation	23
3.2	Thermal shutdown	23
3.3	Current limitation	23
3.4	Negative voltage clamp	23
4	Application information	24
4.1	GND protection network against reverse battery	24
4.1.1	Diode (DGND) in the ground line	24
4.2	Immunity against transient electrical disturbances	25
4.3	MCU I/Os protection	25
4.4	Multisense - analog current sense	26
4.4.1	Principle of Multisense signal generation	26
4.4.2	TCASE and VCC monitor	29
4.4.3	Short to VCC and OFF-state open-load detection	30
5	Maximum demagnetization energy (VCC = 16 V)	31
6	Package and PCB thermal data	32
6.1	PowerSSO-16 thermal data	32
6.2	SO-8 thermal data	34
7	Package information	38
7.1	PowerSSO-16 package information	38
7.2	SO-8 package information	39
7.3	PowerSSO-16 packing information	40

7.4	SO-8 packing information	42
7.5	PowerSSO-16 marking information	44
7.6	SO-8 marking information	45
