## Pin Description

Pin Number SOIC-8	Pin Number TO-263	Pin Name	Pin Function
1	1 (fixed)	EN	Enable (Input): CMOS compatible input. Logic high = enable, logic low = shutdown.
2	2	VBIAS	Input bias voltage for powering all circuitry on the regulator with the exception of the output power device.
3, 6	4	VIN	Input voltage needed for the output power device.
4, 5	5	VOUT	Regulator Output.
7 (adjustable)	1 (adjustable)	ADJ	Adjustable regulator feedback input. Connect to resistor voltage divider.
7 (fixed)		SENSE	Connect to VOUT for fixed voltage options.
8	3	GND	Ground.
9	6	EP	Exposed Pad: Connect to ground pin.

**Absolute Maximum Ratings<sup>(1)</sup>**

Supply Voltage ( $V_{IN}$ )	–0.3V to +4V
Bias Supply Voltage ( $V_{BIAS}$ )	–0.3V to +6V
Enable Input Voltage ( $V_{EN}$ )	–0.3V to $V_{BIAS}$
Power Dissipation	Internally Limited
Storage Temperature ( $T_s$ )	–65°C to +150°C
ESD Rating <sup>(3)</sup>	3kV

**Operating Ratings<sup>(2)</sup>**

Supply Voltage ( $V_{IN}$ )	1V to 3.8V
Bias Supply Voltage ( $V_{BIAS}$ )	3V to 5.5V
Enable Input Voltage ( $V_{EN}$ )	0V to $V_{BIAS}$
Junction Temperature ( $T_J$ )	–40°C ≤ $T_J$ ≤ +125°C
Package Thermal Resistance	
EPAD SOIC ( $\theta_{JA}$ )	41°C/W
TO-263 ( $\theta_{JC}$ )	6.3°C/W

**Electrical Characteristics<sup>(4)</sup>**

$T_A = 25^\circ\text{C}$  with  $V_{BIAS} = V_{OUT} + 2.2\text{V}$ ;  $V_{IN} = V_{OUT} + 1\text{V}$ ;  $I_{LOAD} = 10\text{mA}$ ; **bold** values indicate  $0^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$ , unless otherwise specified.

Parameter	Condition	Min	Typ	Max	Units
Output Voltage Accuracy (Fixed Voltage Options)	Room temperature	1		1	%
	Over temperature range	2		2	%
Line Regulation ( $V_{IN}$ )	$V_{IN} = V_{OUT} + 1\text{V}$ to 3.8V		0.0015	0.1	%/V
Line Regulation ( $V_{BIAS}$ )	$V_{BIAS} = 3\text{V}$ to 5.5V ( $V_{OUT} < 0.8\text{V}$ ) $V_{BIAS} = V_{OUT} + 2.2\text{V}$ to 5.5V ( $V_{OUT} \geq 0.8\text{V}$ )		0.035	<b>0.3</b>	%/V
Feedback Voltage (Adjustable Output Voltage)	Room temperature	0.495	0.5	0.505	V
	Over temperature range	<b>0.490</b>	0.5	<b>0.510</b>	V
Output Voltage Load Regulation	$I_L = 10\text{mA}$ to 3A (SOIC)		0.15	<b>0.5</b>	%
	$I_L = 10\text{mA}$ to 3A (TO-263)		0.15	0.5	%
$V_{IN} - V_{OUT}$ ; Dropout Voltage	$I_L = 1.5\text{A}$		93	<b>250</b>	mV
	$I_L = 3\text{A}$ (SOIC)		205	<b>400</b>	mV
	$I_L = 3\text{A}$ (TO-263)		205	<b>500</b>	mV
$V_{BIAS} - V_{OUT}$ ; Dropout Voltage	$I_L = 3\text{A}$		0.91	<b>2.1</b>	V
$V_{BIAS}$ supply current	$V_{EN} = 2\text{V}$ , $I_L = 100\text{mA}$		2	<b>7.5</b>	mA
	$V_{EN} = 2\text{V}$ , $I_L = 3\text{A}$		30	<b>150</b>	mA
$V_{BIAS}$ shutdown current	$V_{EN} = 0\text{V}$		0.1	1	μA
$V_{IN}$ shutdown current	$V_{EN} = 0\text{V}$		0.1	1	μA
FB bias current	Adj only		0.02	<b>1</b>	μA
UVLO	$V_{BIAS}$ rising	<b>2.7</b>	2.85	<b>3.0</b>	V
	Hysteresis		100		mV
Current Limit	$V_{OUT} = 0\text{V}$	<b>3.3</b>	4.7	<b>9.0</b>	A
<b>Enable Input</b>					
Enable Input Threshold	Regulator enable	<b>1.6</b>	0.85		V
	Regulator shutdown		0.75	<b>0.3</b>	V
Enable Pin Input Current	Independent of state		0.002	<b>1</b>	μA
<b>AC Response</b>					
Large signal bandwidth			1		MHz
PSRR (BIAS) at 10kHz	$V_{BIAS} = 3.3\text{V}$ , $I_{OUT} = 1.5\text{A}$		45		dB
PSRR (IN) at 10kHz	$V_{IN} = V_{OUT} + 1\text{V}$ , $I_{OUT} = 1.5\text{A}$		65		dB
	$V_{IN} = V_{OUT} + 0.3\text{V}$ , $I_{OUT} = 1.5\text{A}$		55		dB
Thermal Shutdown			145		°C

Thermal Shutdown Hysteresis			10		°C
Turn-on Time			90	<b>300</b>	μs

**Notes:**

1. Exceeding the absolute maximum rating may damage the device.
2. The device is not guaranteed to function outside its operating rating.
3. Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5kΩ in series with 100pF.
4. Specification for packaged product only.

## Application Information

The MIC59300 is an ultra-high performance, low-dropout linear regulator designed for high current applications requiring a fast transient response. The MIC59300 utilizes two input supplies, significantly reducing dropout voltage, making it perfect for low-voltage, DC-to-DC conversion. The MIC59300 requires a minimum number of external components, and as a  $\mu$ Cap regulator, the output is tolerant of virtually any type of capacitor, including ceramic type and tantalum type capacitors.

The MIC59300 regulator is fully protected from damage due to fault conditions, offering linear current limiting and thermal shutdown.

### Bias Supply Voltage

$V_{BIAS}$ , requiring relatively light current, provides power to the control portion of the MIC59300.  $V_{BIAS}$  requires approximately 30mA for a 3A load current. Dropout conditions require higher currents. Most of the biasing current is used to supply the base current to the pass transistor. The bias voltage allows the pass element to be driven into saturation, reducing the dropout to 205mV at a 3A load current. Bypassing on the bias pin is recommended to improve performance of the regulator during line and load transients. Small ceramic capacitors from  $V_{BIAS}$ -to-ground help reduce high frequency noise from being injected into the control circuitry from the bias rail and constitute good design practice. Good bypass techniques typically include one larger capacitor such as 1 $\mu$ F ceramic and smaller valued capacitors such as 0.01 $\mu$ F or 0.001 $\mu$ F in parallel with that larger capacitor to decouple the bias supply. The  $V_{BIAS}$  input voltage must be 2.1V above the output voltage with a minimum  $V_{BIAS}$  input voltage of 3V.

### Input Supply Voltage

$V_{IN}$  provides the high current to the collector of the pass transistor. The minimum input voltage is 1.0V, allowing conversion from low voltage supplies.

### Output Capacitor

The MIC59300 requires a minimum of output capacitance to maintain stability. However, proper capacitor selection is important to ensure desired transient response. The MIC59300 is specifically designed to be stable with virtually any capacitance value and ESR. A 1 $\mu$ F ceramic chip capacitor should satisfy most applications. Output capacitance can be increased without bound. See the "Functional Characteristics" for examples of load transient response.

X7R dielectric ceramic capacitors are recommended because of their temperature performance. X7R-type capacitors change capacitance by 15% over their operating temperature range and are the most stable type of ceramic capacitors. Z5U and Y5V dielectric

capacitors change value by as much as 50% and 60% respectively over their operating temperature ranges. To use a ceramic chip capacitor with Y5V dielectric, the value must be much higher than an X7R ceramic or a tantalum capacitor to ensure the same capacitance value over the operating temperature range. Tantalum capacitors have a very stable dielectric (10% over their operating temperature range) and can also be used with this device.

### Input Capacitor

An input capacitor of 1 $\mu$ F or greater is recommended when the device is more than 4 inches away from the bulk supply capacitance, or when the supply is a battery. Small, surface-mount, ceramic chip capacitors can be used for the bypassing. The capacitor should be placed within 1 inch of the device for optimal performance. Larger values will help to improve ripple rejection by bypassing the input to the regulator, further improving the integrity of the output voltage.

### Thermal Design

Linear regulators are simple to use. The most complicated design parameters to consider are thermal characteristics. Thermal design requires the following application-specific parameters:

- Maximum ambient temperature ( $T_A$ )
- Output current ( $I_{OUT}$ )
- Output voltage ( $V_{OUT}$ )
- Input voltage ( $V_{IN}$ )
- Ground current ( $I_{GND}$ )

First, calculate the power dissipation ( $P_D$ ) of the regulator from these numbers and the device parameters from this datasheet.

$$P_D = V_{IN} \times I_{IN} + V_{BIAS} \times I_{BIAS} - V_{OUT} \times I_{OUT}$$

The input current will be less than the output current at high output currents as the load increases. The bias current is a sum of base drive and ground current. Ground current is constant over load current. Then the heat sink thermal resistance is determined with this formula:

$$\theta_{SA} = \left( \frac{T_{J(MAX)} - T_A}{P_D} \right) - (\theta_{JC} + \theta_{CS})$$

The heat sink may be significantly reduced in applications where the maximum input voltage is known and large compared with the dropout voltage. Use a series input resistor to drop excessive voltage and distribute the heat between this resistor and the regulator. The low-dropout properties of the MIC59300 allow significant reductions in regulator power dissipation and the associated heat sink without compromising performance. When this technique is employed, a

capacitor of at least 1μF is needed directly between the input and regulator ground. Refer to “*Application Note 9*” ([http://www.micrel.com/\\_PDF/App-Notes/an-9.pdf](http://www.micrel.com/_PDF/App-Notes/an-9.pdf)) for further details and examples on thermal design and heat sink specification.

#### Minimum Load Current

The MIC59300, unlike most other high current regulators, does not require a minimum load to maintain output voltage regulation.

#### Adjustable Regulator Design

The MIC59300 adjustable version allows programming the output voltage anywhere between 0.5V and 3.3V. Two resistors are used. The resistor value between V<sub>OUT</sub> and the adjust pin should not exceed 10kΩ. Larger values can cause instability. The resistor values are calculated by:

$$R_1 = R_2 \times \left( \frac{V_{OUT}}{0.5} - 1 \right)$$

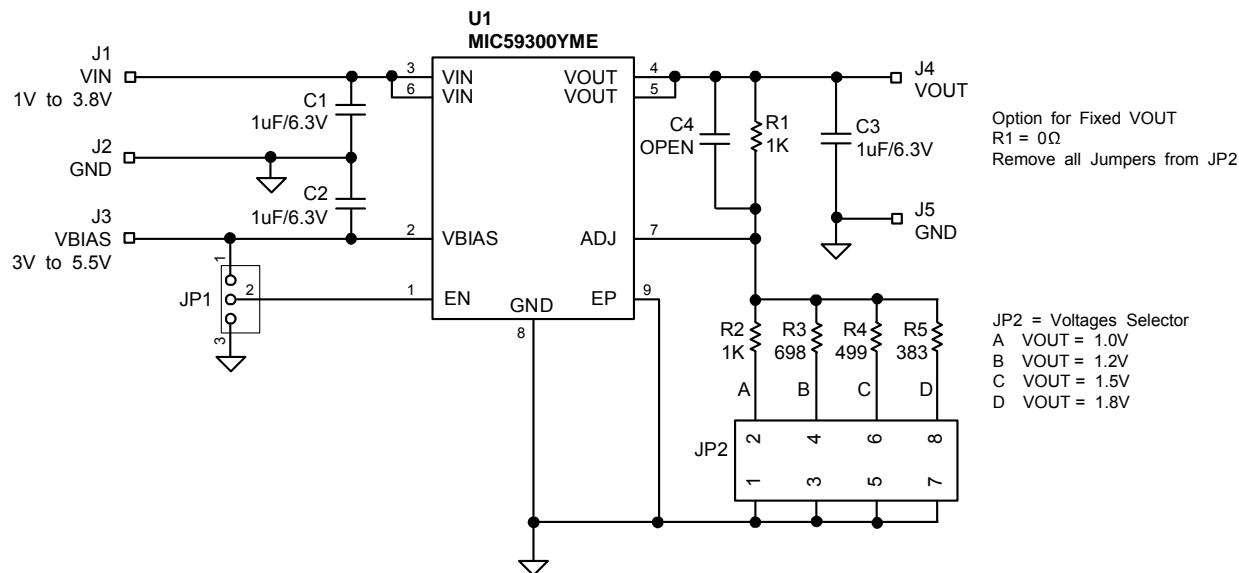

where V<sub>OUT</sub> is the desired output voltage.

#### Enable

An active high enable input (EN) allows on-off control of the regulator. Current drain reduces to “zero” when the device is shutdown, with only microamperes of leakage current. The EN input has CMOS compatible thresholds for simple logic interfacing. EN may be directly tied to V<sub>BIAS</sub> and pulled up to the maximum supply voltage.

#### EPad

The exposed pad on the bottom of the SOIC part must be connected to ground.
