## 2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

TABLE 2-1: PIN FUNCTION TABLE

Pin Number (40-Pin PDIP) (40-Pin Cerdip)	Pin Number (44-Pin PQFP)	Symbol	Description
1	8	HLDR	Hold pin, Logic 1 holds present display reading.
2	9	D <sub>1</sub>	Activates the D section of the units display.
3	10	C <sub>1</sub>	Activates the C section of the units display.
4	11	B <sub>1</sub>	Activates the B section of the units display.
5	12	A <sub>1</sub>	Activates the A section of the units display.
6	13	F <sub>1</sub>	Activates the F section of the units display.
7	14	G <sub>1</sub>	Activates the G section of the units display.
8	15	E <sub>1</sub>	Activates the E section of the units display.
9	16	D <sub>2</sub>	Activates the D section of the tens display.
10	17	C <sub>2</sub>	Activates the C section of the tens display.
11	18	B <sub>2</sub>	Activates the B section of the tens display.
12	19	A <sub>2</sub>	Activates the A section of the tens display.
13	20	F <sub>2</sub>	Activates the F section of the tens display.
14	21	E <sub>2</sub>	Activates the E section of the tens display.
15	22	D <sub>3</sub>	Activates the D section of the hundreds display.
16	23	B <sub>3</sub>	Activates the B section of the hundreds display.
17	24	F <sub>3</sub>	Activates the F section of the hundreds display.
18	25	E <sub>3</sub>	Activates the E section of the hundreds display.
19	26	AB <sub>4</sub>	Activates both halves of the 1 in the thousands display.
20	27	POL	Activates the negative polarity display.
21	28	BP/ GND	LCD backplane drive output (TC7116/TC7116A). Digital ground (TC7117/TC7117A).
22	29	G <sub>3</sub>	Activates the G section of the hundreds display.
23	30	A <sub>3</sub>	Activates the A section of the hundreds display.
24	31	C <sub>3</sub>	Activates the C section of the hundreds display.
25	32	G <sub>2</sub>	Activates the G section of the tens display.
26	34	V-	Negative power supply voltage.
27	35	V <sub>INT</sub>	Integrator output. Connection point for integration capacitor. See <b>Section 4.3 “Integrating Capacitor”</b> , Integrating Capacitor for more details.
28	36	V <sub>BUFF</sub>	Integration resistor connection. Use a 47kΩ resistor for a 200mV full scale range and a 470kΩ resistor for 2V full scale range.
29	37	C <sub>AZ</sub>	The size of the auto-zero capacitor influences system noise. Use a 0.47μF capacitor for 200mV full scale, and a 0.047μF capacitor for 2V full scale. See <b>Section 4.1 “Auto-Zero Capacitor”</b> , Auto-Zero Capacitor for more details.
30	38	V <sub>IN-</sub>	The analog LOW input is connected to this pin.
31	39	V <sub>IN+</sub>	The analog HIGH input signal is connected to this pin.
32	40	COMMON	This pin is primarily used to set the Analog Common mode voltage for battery operation, or in systems where the input signal is referenced to the power supply. It also acts as a reference voltage source. See <b>Section 3.1.6 “Analog Common”</b> , Analog Common for more details.
33	41	C <sub>REF-</sub>	See Pin 34.

**TABLE 2-1: PIN FUNCTION TABLE (CONTINUED)**

Pin Number (40-Pin PDIP) (40-Pin Cerdip)	Pin Number (44-Pin PQFP)	Symbol	Description
34	42	C <sub>REF</sub> +	A 0.1μF capacitor is used in most applications. If a large Common mode voltage exists (for example, the V <sub>IN</sub> - pin is not at analog common), and a 200mV scale is used, a 1μF capacitor is recommended and will hold the rollover error to 0.5 count.
35	43	V+	Positive Power Supply Voltage.
36	44	V <sub>REF</sub> +	The analog input required to generate a full scale output (1999 counts). Place 100mV between Pins 32 and 36 for 199.9mV full scale. Place 1V between Pins 35 and 36 for 2V full scale. See <b>Section 4.6 “Reference Voltage”</b> , Reference Voltage.
37	3	TEST	Lamp test. When pulled HIGH (to V+), all segments will be turned on and the display should read -1888. It may also be used as a negative supply for externally generated decimal points. See <b>Section 3.1.7 “Test”</b> , TEST for additional information.
38	4	OSC3	See Pin 40.
39	6	OSC2	See Pin 40.
40	7	OSC1	Pins 40, 39, 38 make up the oscillator section. For a 48kHz clock (3 readings per section), connect Pin 40 to the junction of a 100kΩ resistor and a 100pF capacitor. The 100kΩ resistor is tied to Pin 39 and the 100pF capacitor is tied to Pin 38.

# TC7116/A/TC7117/A

## 3.0 DETAILED DESCRIPTION

(All Pin Designations Refer to 40-Pin PDIP.)

### 3.1 Analog Section

Figure 3-1 shows the block diagram of the analog section for the TC7116/TC7116A and TC7117/TC7117A. Each measurement cycle is divided into three phases: (1) Auto-Zero (AZ), (2) Signal Integrate (INT), and (3) Reference Integrate (REF), or De-integrate (DE).

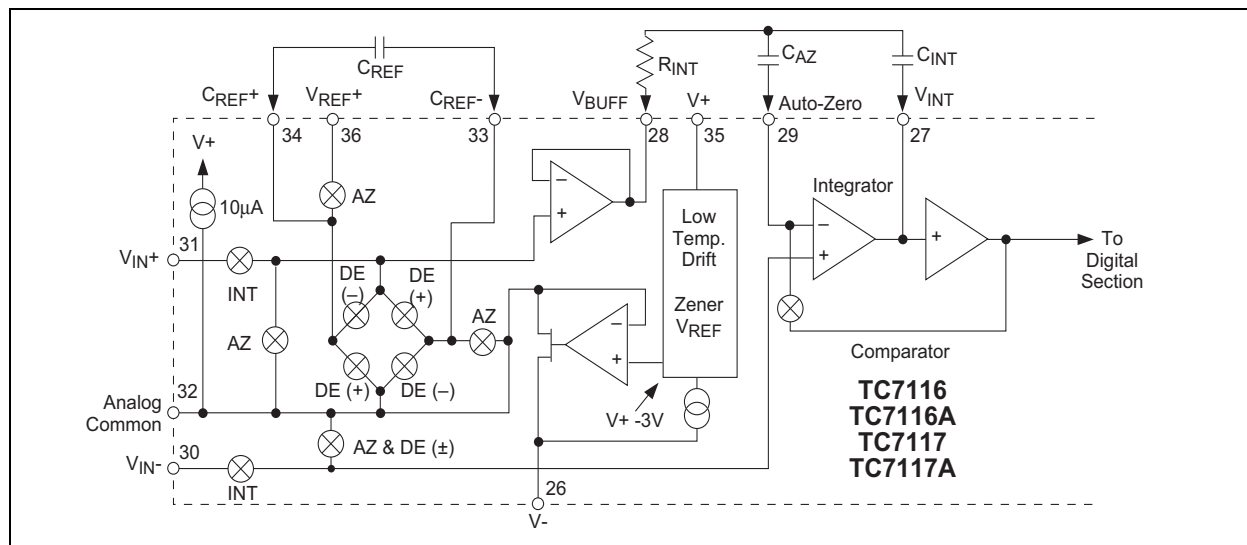

#### 3.1.1 AUTO-ZERO PHASE

High and low inputs are disconnected from the pins and internally shorted to analog common. The reference capacitor is charged to the reference voltage. A feedback loop is closed around the system to charge the auto-zero capacitor ( $C_{AZ}$ ) to compensate for offset voltages in the buffer amplifier, integrator, and comparator.

Since the comparator is included in the loop, AZ accuracy is limited only by system noise. The offset referred to the input is less than  $10\mu\text{V}$ .

#### 3.1.2 SIGNAL INTEGRATE PHASE

The auto-zero loop is opened, the internal short is removed, and the internal high and low inputs are connected to the external pins. The converter then integrates the differential voltages between  $V_{IN+}$  and  $V_{IN-}$  for a fixed time. This differential voltage can be within a wide Common mode range: 1V of either supply. However, if the input signal has no return with respect to the converter power supply,  $V_{IN-}$  can be tied to analog common to establish the correct Common mode voltage. At the end of this phase, the polarity of the integrated signal is determined.

**FIGURE 3-1:** Analog Section of TC7116/TC7116A and TC7117/TC7117A

#### 3.1.3 REFERENCE INTEGRATE PHASE

The final phase is reference integrate, or de-integrate. Input low is internally connected to analog common and input high is connected across the previously charged reference capacitor. Circuitry within the chip ensures that the capacitor will be connected with the correct polarity to cause the integrator output to return to zero. The time required for the output to return to zero is proportional to the input signal. The digital reading displayed is:

#### 3.1.4 REFERENCE

The positive reference voltage ( $V_{REF+}$ ) is referred to analog common.

#### EQUATION 3-1:

$$1000 = \frac{V_{IN}}{V_{REF}}$$

## 3.1.5 DIFFERENTIAL INPUT

This input can accept differential voltages anywhere within the Common mode range of the input amplifier or, specifically, from 1V below the positive supply to 1V above the negative supply. In this range, the system has a CMRR of 86dB, typical. However, since the integrator also swings with the Common mode voltage, care must be exercised to ensure that the integrator output does not saturate. A worst-case condition would be a large, positive Common mode voltage with a near full scale negative differential input voltage. The negative input signal drives the integrator positive, when most of its swing has been used up by the positive Common mode voltage. For these critical applications, the integrator swing can be reduced to less than the recommended 2V full scale swing with little loss of accuracy. The integrator output can swing within 0.3V of either supply without loss of linearity.

## 3.1.6 ANALOG COMMON

This pin is included primarily to set the Common mode voltage for battery operation (TC7116/TC7116A), or for any system where the input signals are floating, with respect to the power supply. The analog common pin sets a voltage approximately 2.8V more negative than the positive supply. This is selected to give a minimum end of life battery voltage of about 6V. However, analog common has some attributes of a reference voltage. When the total supply voltage is large enough to cause the Zener to regulate ( $>7V$ ), the analog common voltage will have a low voltage coefficient (0.001%), low output impedance ( $\approx 15\Omega$ ), and a temperature coefficient of less than 20ppm/ $^{\circ}C$ , typically, and 50 ppm maximum. The TC7116/TC7117 temperature coefficients are typically 80ppm/ $^{\circ}C$ .

An external reference may be used, if necessary, as shown in Figure 3-2.

**FIGURE 3-2:** Using an External Reference

Analog common is also used as  $V_{IN-}$  return during auto-zero and de-integrate. If  $V_{IN-}$  is different from analog common, a Common mode voltage exists in the system and is taken care of by the excellent CMRR of the converter. However, in some applications,  $V_{IN-}$  will be set at a fixed, known voltage (power supply common for instance). In this application, analog common should be tied to the same point, thus removing the Common mode voltage from the converter. The same holds true for the reference voltage; if it can be conveniently referenced to analog common, it should be. This removes the Common mode voltage from the reference system.

Within the IC, analog common is tied to an N-channel FET, that can sink 30mA or more of current to hold the voltage 3V below the positive supply (when a load is trying to pull the analog common line positive). However, there is only 10μA of source current, so analog common may easily be tied to a more negative voltage, thus overriding the internal reference.

## 3.1.7 TEST

The TEST pin serves two functions. On the TC7117/TC7117A, it is coupled to the internally generated digital supply through a 500Ω resistor. Thus, it can be used as a negative supply for externally generated segment drivers, such as decimal points, or any other presentation the user may want to include on the LCD. (Figure 3-3 and Figure 3-4 show such an application.) No more than a 1mA load should be applied.

The second function is a "lamp test." When TEST is pulled HIGH (to  $V+$ ), all segments will be turned ON and the display should read -1888. The TEST pin will sink about 10mA under these conditions.

**FIGURE 3-3:** Simple Inverter for Fixed Decimal Point

\_\_\_\_\_

Figure 3-5 and Figure show the digital section for TC7116/TC7116A and TC7117/TC7117A, respectively. For the TC7116/TC7116A (Figure 3-5), an internal digital ground is generated from a 6V Zener diode and a

Figure 1 is the digital section of the TC7117/TC7117A. It is identical to the TC7116/TC7116A, except that the regulated supply and BP drive have been eliminated, and the segment drive is typically 8mA. The 1000's output (Pin 19) sinks current from two LED segments, and has a 16mA drive capability. The TC7117/TC7117A are designed to drive common anode LED displays.

In both devices, the polarity indication is ON for analog inputs. If  $V_{IN-}$  and  $V_{IN+}$  are reversed, this indication can be reversed also, if desired.

## 4.0 COMPONENT VALUE SELECTION

### 4.1 Auto-Zero Capacitor

The size of the auto-zero capacitor has some influence on system noise. For 200mV full scale, where noise is very important, a 0.47 $\mu$ F capacitor is recommended. On the 2V scale, a 0.047 $\mu$ F capacitor increases the speed of recovery from overload and is adequate for noise on this scale.

### 4.2 Reference Capacitor

A 0.1 $\mu$ F capacitor is acceptable in most applications. However, where a large Common mode voltage exists (i.e., the  $V_{IN-}$  pin is not at analog common), and a 200mV scale is used, a larger value is required to prevent rollover error. Generally, 1 $\mu$ F will hold the rollover error to 0.5 count in this instance.

### 4.3 Integrating Capacitor

The integrating capacitor should be selected to give the maximum voltage swing that ensures tolerance buildup will not saturate the integrator swing (approximately 0.3V from either supply). In the TC7116/TC7116A or the TC7117/TC7117A, when the analog common is used as a reference, a nominal  $\pm 2$ V full scale integrator swing is acceptable. For the TC7117/TC7117A, with  $\pm 5$ V supplies and analog common tied to supply ground, a  $\pm 3.5$ V to  $\pm 4$ V swing is nominal. For 3 readings per second (48kHz clock), nominal values for  $C_{INT}$  are 0.22 $\mu$ F and 0.10 $\mu$ F, respectively. If different oscillator frequencies are used, these values should be changed in inverse proportion to maintain the output swing. The integrating capacitor must have low dielectric absorption to prevent rollover errors. Polypropylene capacitors are recommended for this application.

### 4.4 Integrating Resistor

Both the buffer amplifier and the integrator have a class A output stage with 100 $\mu$ A of quiescent current. They can supply 20 $\mu$ A of drive current with negligible non-linearity. The integrating resistor should be large enough to remain in this very linear region over the input voltage range, but small enough that undue leakage requirements are not placed on the PC board. For 2V full scale, 470k $\Omega$  is near optimum and, similarly, 47k $\Omega$  for 200mV full scale.

### 4.5 Oscillator Components

For all frequency ranges, a 100k $\Omega$  resistor is recommended; the capacitor is selected from the equation:

#### EQUATION 4-1:

$$f = \frac{0.45}{RC}$$

For a 48kHz clock (3 readings per second),  $C = 100$ pF.

### 4.6 Reference Voltage

To generate full scale output (2000 counts), the analog input requirement is  $V_{IN} = 2V_{REF}$ . Thus, for the 200mV and 2V scale,  $V_{REF}$  should equal 100mV and 1V, respectively. In many applications, where the ADC is connected to a transducer, a scale factor exists between the input voltage and the digital reading. For instance, in a measuring system, the designer might like to have a full scale reading when the voltage from the transducer is 700mV. Instead of dividing the input down to 200mV, the designer should use the input voltage directly and select  $V_{REF} = 350$ mV. Suitable values for integrating resistor and capacitor would be 120k $\Omega$  and 0.22 $\mu$ F. This makes the system slightly quieter and also avoids a divider network on the input. The TC7117/TC7117A, with  $\pm 5$ V supplies, can accept input signals up to  $\pm 4$ V. Another advantage of this system is when a digital reading of zero is desired for  $V_{IN} \neq 0$ . Temperature and weighing systems with a variable tare are examples. This offset reading can be conveniently generated by connecting the voltage transducer between  $V_{IN+}$  and analog common, and the variable (or fixed) offset voltage between analog common and  $V_{IN-}$ .

# TC7116/A/TC7117/A

## 6.0 TYPICAL APPLICATIONS

The TC7117/TC7117A sink the LED display current, causing heat to build up in the IC package. If the internal voltage reference is used, the changing chip temperature can cause the display to change reading. By reducing the LED common anode voltage, the TC7117/TC7117A package power dissipation is reduced.

Figure 6-1 is a curve tracer display showing the relationship between output current and output voltage for typical TC7117CPL/TC7117ACPL devices. Since a typical LED has 1.8V across it at 8mA and its common anode is connected to +5V, the TC7117/TC7117A output is at 3.2V (Point A, Figure 6-1). Maximum power dissipation is  $8.1\text{mA} \times 3.2\text{V} \times 24 \text{ segments} = 622\text{mW}$ .

However, notice that once the TC7117/TC7117A's output voltage is above 2V, the LED current is essentially constant as output voltage increases. Reducing the output voltage by 0.7V (Point B Figure 6-1) results in 7.7mA of LED current, only a 5% reduction. Maximum power dissipation is now only  $7.7\text{mA} \times 2.5\text{V} \times 24 = 462\text{mW}$ , a reduction of 26%. An output voltage reduction of 1V (Point C) reduces LED current by 10% (7.3mA), but power dissipation by 38% ( $7.3\text{mA} \times 2.2\text{V} \times 24 = 385\text{mW}$ ).

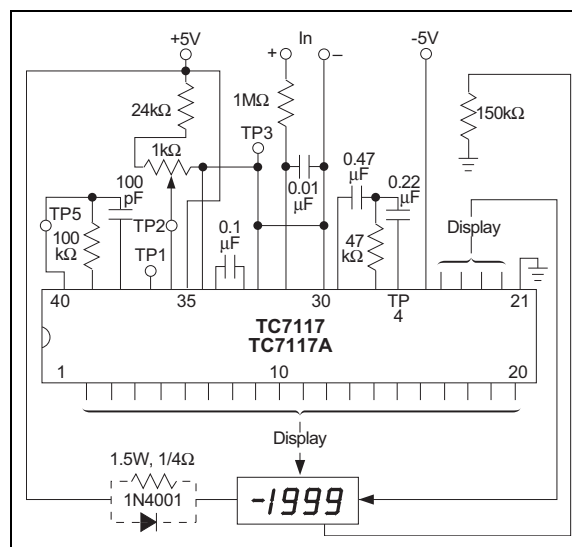

**FIGURE 6-1:** TC7117/TC7117A Output vs. Output Voltage

Reduced power dissipation is very easy to obtain. Figure 6-2 shows two ways: either a 5.1Ω, 1/4W resistor, or a 1A diode placed in series with the display (but not in series with the TC7117/TC7117A). The resistor reduces the TC7117/TC7117A's output voltage (when all 24 segments are ON) to Point C of Figure 6-1. When segments turn off, the output voltage will increase. The diode, however, will result in a relatively steady output voltage, around Point B.

In addition to limiting maximum power dissipation, the resistor reduces change in power dissipation as the display changes. The effect is caused by the fact that, as fewer segments are ON, each ON output drops more voltage and current. For the best-case of six segments (a "111" display) to worst-case (a "1888" display), the resistor circuit will change about 230mW, while a circuit without the resistor will change about 470mW. Therefore, the resistor will reduce the effect of display dissipation on reference voltage drift by about 50%.

The change in LED brightness caused by the resistor is almost unnoticeable as more segments turn off. If display brightness remaining steady is very important to the designer, a diode may be used instead of the resistor.

### 40-Pin PDIP (Wide)

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

### 40-Pin Cerdip (Wide)

## 7.3 Package Dimensions (Continued)

### Component Taping Orientation for 44-Pin PLCC Devices

#### Carrier Tape, Number of Components Per Reel and Reel Size

Package	Carrier Width (W)	Pitch (P)	Part Per Full Reel	Reel Size
44-Pin PLCC	32 mm	24 mm	500	13 in

**Note:** Drawing does not represent total number of pins.

**Dimensions: inches (mm)**

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

### 44-Pin PQFP

**Dimensions: inches (mm)**

## 8.0 REVISION HISTORY

### Revision D (December 2012)

Added a note to each package outline drawing.

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

# TC7116/A/TC7117/A

---

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

#### Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, KEELOQ, KEELOQ logo, MPLAB, PIC, PICmicro, PICSTART, PIC<sup>32</sup> logo, rPIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, HI-TECH C, Linear Active Thermistor, MTP, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

Analog-for-the-Digital Age, Application Maestro, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, HI-TIDE, In-Circuit Serial Programming, ICSP, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Omniscent Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PICkit, PICTail, REAL ICE, rLAB, Select Mode, SQL, Serial Quad I/O, Total Endurance, TSHARC, UniWinDriver, WiperLock, ZENA and Z-Scale are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

GestIC and ULPP are registered trademarks of Microchip Technology Germany II GmbH & Co. & KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

**QUALITY MANAGEMENT SYSTEM**  
**CERTIFIED BY DNV**  
**= ISO/TS 16949 =**

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
