

SELECTION GUIDE

Part Number	T _A (°C)	Optimized Accuracy Range, I _P (A)	Sensitivity ^[2] , Sens (Typ) (mV/A)	Package	Packing ^[1]
ACS711ELCTR-12AB-T	-40 to 85	±12.5	110	8-pin SOICN	3000 pieces/reel
ACS711KLCTR-12AB-T	-40 to 125				
ACS711ELCTR-25AB-T	-40 to 85	±25	55		
ACS711KLCTR-25AB-T	-40 to 125				
ACS711EEXLT-31AB-T ^{[3][4]}	-40 to 85	±31	45	12-contact QFN with fused current loop	1500 pieces/reel
ACS711KEXLT-31AB-T ^[3]	-40 to 125				
ACS711EEXLT-15AB-T ^{[3][4]}	-40 to 85	±15.5	90		
ACS711KEXLT-15AB-T ^[3]	-40 to 125				

^[1] Contact Allegro for additional packing options.

^[2] Sensitivity measured with V_{CC} = 3.3 V.

^[3] QFN package not qualified for automotive applications.

^[4] Variants ACS711EEXLT-15AB-T and ACS711EEXLT-31AB-T are Pre-End-of-Life. These device variants are approaching end of life. Within a minimum of 6 months, these device variants will enter their final, Last Time Buy, order phase. Date of status change: June 5, 2017. Suggested replacements include ACS711KEXLT-15AB-T and ACS711KEXLT-31AB-T, respectively.

ABSOLUTE MAXIMUM RATINGS

Characteristic	Symbol	Notes		Rating	Units

PINOUT DIAGRAMS

TERMINAL LIST TABLE

Name	Number		Description
	EX	LC	
GND	5	5	Signal ground terminal
FAULT	6	6	Overcurrent fault; active low
IP-	3 and 4	3 and 4	Terminals for current being sensed; fused internally
IP+	1 and 2	1 and 2	Terminals for current being sensed; fused internally
NC	7, 8, 9, 10	—	No connection; connect to GND for optimal ESD performance.
VCC	12	8	Device power supply terminal
VIOUT	11	7	Analog output signal

COMMON OPERATING CHARACTERISTICS: Valid across the full range of T_A for the LC package and at $T_A = 25^\circ\text{C}$ for the EX package, $V_{CC} = 3.3\text{ V}$, unless otherwise specified

Characteristic	Symbol	Test Conditions	Min.	Typ.	Max.	Units
ELECTRICAL CHARACTERISTICS						
Supply Voltage ^[1]	V_{CC}		3	3.3	5.5	V
Supply Current	I_{CC}	$V_{CC} = 3.3\text{ V}$, output open	–	4	5.5	mA
Output Capacitance Load	C_{LOAD}	VIOUT to GND	–	–	1	nF
Output Resistive Load	R_{LOAD}	VIOUT to GND	15	–	–	k Ω
Primary Conductor Resistance	R_{IP}	EX package	–	0.6	–	m Ω
		LC package, $T_A = 25^\circ\text{C}$	–	1.2	–	m Ω
Primary Conductor Inductance	L_{IP}	$T_A = 25^\circ\text{C}$	–	2	–	nH
VIOUT Rise Time	t_r	$I_P = I_{P(max)}$, $T_A = 25^\circ\text{C}$, $C_{LOAD} = 0\text{ nF}$	–	3.5	–	μs
Propagation Delay Time	t_{PROP}	$I_P = I_{P(max)}$, $T_A = 25^\circ\text{C}$, $C_{LOAD} = 0\text{ nF}$	–	1.2	–	μs
Response Time	$t_{RESPONSE}$	$I_P = I_{P(max)}$, $T_A = 25^\circ\text{C}$, $C_{LOAD} = 0\text{ nF}$	–	4.6	–	μs
Output Slew Rate	SR	$T_A = 25^\circ\text{C}$, $C_{LOAD} = 0\text{ nF}$	–	0.30	–	V/ μs
Internal Bandwidth ^[2]	BW_I	–3 dB, $T_A = 25^\circ\text{C}$	–	100	–	kHz
Nonlinearity	E_{LIN}	Over full range of I_P	–	± 1	–	%
Symmetry	E_{SYM}	Apply full scale I_P	–	100	–	%
VIOUT Saturation Voltages	V_{IOH}		$V_{CC} - 0.3$	–	–	V
	V_{IOL}		–	–	0.3	V
Quiescent Output Voltage	$V_{IOUT(Q)}$	$I_P = 0\text{ A}$, $T_A = 25^\circ\text{C}$	–	$V_{CC} / 2$	–	V
Power-On Time	t_{PO}	Output reaches 90% of steady-state level, $T_A = 25^\circ\text{C}$, 20 A present on primary conductor	–	35	–	μs
FAULT PIN CHARACTERISTICS						
FAULT Operating Point	I_{FAULT}		–	$\pm 1 \times I_P$	–	A
FAULT Output Pullup Resistor	R_{PU}		1	–	–	k Ω
FAULT Output Voltage	V_{OH}		–	$V_{CC} - 0.3$	–	V
	V_{OL}	$R_{PU} = 1\text{ k}\Omega$	–	0.3	–	V
FAULT Response Time	t_{FAULT}	Measured from $ I_P > I_{FAULT} $ to $V_{FAULT} \leq V_{OL}$	–	1.3	–	μs
V_{CC} Off Voltage Level for Fault Reset ^[3]	V_{CCFR}		–	–	200	mV
V_{CC} Off Duration for Fault Reset ^[3]	t_{CCFR}		100	–	–	μs

^[1] Devices are programmed for maximum accuracy at 3.3 V V_{CC} levels. The device contains ratiometry circuits that accurately alter the 0 A Output Voltage and Sensitivity level of the device in proportion to the applied V_{CC} level. However, as a result of minor nonlinearities in the ratiometry circuit additional output error will result when V_{CC} varies from the 3.3 V V_{CC} level. Customers that plan to operate the device from a 5 V regulated supply should contact their local Allegro sales representative regarding expected device accuracy levels under these bias conditions.

^[2] Calculated using the formula $BW_I = 0.35 / t_r$.

^[3] After the FAULT pin is latched low, the only way to reset it is through a power-off and power-on cycle on the VCC pin. For fault reset, V_{CC} must stay below V_{CCFR} for a period greater than t_{CCFR} before settling to the normal operation voltage (3 to 5.5 V).

CHARACTERISTIC PERFORMANCE
ACS711 TYPICAL FREQUENCY RESPONSE

For information regarding bandwidth characterization methods used for the ACS711, see the “Characterizing System Bandwidth” application note (<https://allegromicro.com/en/insights-and-innovations/technical-documents/hall-effect-sensor-ic-publications/an296169-ac720-bandwidth-testing>) on the Allegro website.

DEFINITIONS OF ACCURACY CHARACTERISTICS

Sensitivity (Sens). The change in sensor output in response to a 1 A change through the primary conductor. The sensitivity is the product of the magnetic circuit sensitivity (G/A) and the linear IC amplifier gain (mV/G). The linear IC amplifier gain is programmed at the factory to optimize the sensitivity (mV/A) for the full-scale current of the device.

Noise (V_{NOISE}). The product of the linear IC amplifier gain (mV) and the noise floor for the Allegro Hall effect linear IC. The noise floor is derived from the thermal and shot noise observed in Hall elements. Dividing the noise (mV) by the sensitivity (mV/A) provides the smallest current that the device is able to resolve.

Linearity (E_{LIN}). The degree to which the voltage output from the sensor varies in direct proportion to the primary current through its full-scale amplitude. Nonlinearity in the output can be attributed to the saturation of the flux concentrator approaching the full-scale current. The following equation is used to derive the linearity:

$$100 \left\{ 1 - \left[\frac{\Delta \text{gain} \times \% \text{ sat} (V_{\text{IOUT_full-scale amperes}} - V_{\text{IOUT(Q)}})}{2 (V_{\text{IOUT_half-scale amperes}} - V_{\text{IOUT(Q)}})} \right] \right\}$$

where $V_{\text{IOUT_full-scale amperes}}$ = the output voltage (V) when the sensed current approximates full-scale $\pm I_P$.

Symmetry (E_{SYM}). The degree to which the absolute voltage output from the sensor varies in proportion to either a positive or negative full-scale primary current. The following formula is used to derive symmetry:

$$100 \left(\frac{V_{\text{IOUT_+ full-scale amperes}} - V_{\text{IOUT(Q)}}}{V_{\text{IOUT(Q)}} - V_{\text{IOUT_full-scale amperes}}} \right)$$

Quiescent output voltage (V_{IOUT(Q)}). The output of the sensor when the primary current is zero. For a unipolar supply voltage, it nominally remains at $V_{CC}/2$. Thus, $V_{CC} = 3.3 \text{ V}$ translates into $V_{\text{IOUT(Q)}} = 1.65 \text{ V}$. Variation in $V_{\text{IOUT(Q)}}$ can be attributed to the resolution of the Allegro linear IC quiescent voltage trim and thermal drift.

Electrical offset voltage (V_{OE}). The deviation of the device output from its ideal quiescent value of $V_{CC}/2$ due to nonmagnetic causes. To convert this voltage to amperes, divide by the device sensitivity, Sens.

Accuracy (E_{TOT}). The accuracy represents the maximum deviation of the actual output from its ideal value. This is also known as the total output error. The accuracy is illustrated graphically in the output voltage versus current chart below.

Ratiometry. The ratiometric feature means that its 0 A output, $V_{\text{IOUT(Q)}}$, (nominally equal to $V_{CC}/2$) and sensitivity, Sens, are proportional to its supply voltage, V_{CC} . The following formula is used to derive the ratiometric change in 0 A output voltage, $\Delta V_{\text{IOUT(Q)RAT}}$ (%):

The ratiometric change in sensitivity, $\Delta \text{Sens}_{\text{RAT}}$ (%), is defined as:

$$100 \left(\frac{V_{\text{IOUT(Q)}/V_{CC}} / V_{\text{IOUT(Q)}/3.3\text{V}}}{V_{CC} / 3.3 \text{ V}} \right)$$

$$100 \left(\frac{\text{Sens}_{V_{CC}} / \text{Sens}_{3.3\text{V}}}{V_{CC} / 3.3 \text{ V}} \right)$$

Output Voltage versus Sensed Current
Accuracy at 0 A and at Full-Scale Current

DEFINITIONS OF DYNAMIC RESPONSE CHARACTERISTICS

Power-On Time (t_{PO}). When the supply is ramped to its operating voltage, the device requires a finite time to power its internal components before responding to an input magnetic field. Power-On Time, t_{PO} , is defined as the time it takes for the output voltage to settle within $\pm 10\%$ of its steady state value under an applied magnetic field, after the power supply has reached its minimum specified operating voltage, $V_{CC}(\text{min.})$, as shown in the chart at right.

Rise time (t_r). The time interval between a) when the sensor reaches 10% of its full scale value, and b) when it reaches 90% of its full scale value. The rise time to a step response is used to derive the bandwidth of the current sensor, in which $f(-3 \text{ dB}) = 0.35/t_r$. Both t_r and t_{RESPONSE} are detrimentally affected by eddy current losses observed in the conductive IC ground plane.

APPLICATION INFORMATION

Layout

To optimize thermal and electrical performance, the following features should be included in the printed circuit board:

- The primary leads should be connected to as much copper area as is available.
- The copper should be 2 oz. or heavier.
- Additional layers of the board should be used for conducting the primary current if possible, and should be connected using the arrangement of vias shown below.
- The two solder pads at the ends of the exposed pad loop should be placed directly on the copper trace that conducts the primary current.
- When using vias under exposed pads, such as with the EX package, using plugged vias prevents wicking of the solder from the pad into the via during reflow. Whether or not to use plugged vias should be evaluated in the application.

Suggested Layout. EX package shown.

Thermal Rise vs. Primary Current

Self-heating due to the flow of current should be considered during the design of any current sensing system. The sensor, printed circuit board (PCB), and contacts to the PCB will generate heat as current moves through the system.

The thermal response is highly dependent on PCB layout, copper thickness, cooling techniques, and the profile of the injected current. The current profile includes peak current, current “on-time”, and duty cycle. While the data presented in this section was collected with direct current (DC), these numbers may be used to approximate thermal response for both AC signals and current pulses.

The plots in Figure 1 and Figure 3 show the measured rise in steady-state die temperature of the ACS711 in the LC package and EX package, respectively, versus continuous current at an ambient temperature, T_A , of 25 °C. The thermal offset curves may be directly applied to other values of T_A . Figure 2 and Figure 4 show the maximum continuous current at a given T_A . Surges beyond the maximum current listed in Figure 2 and Figure 4 are allowed given the maximum junction temperature, $T_{J(MAX)}$ (165°C), is not exceeded.

Figure 1: Self-Heating in the LC Package Due to Current Flow

Figure 2: Maximum Continuous Current in the LC Package at a Given T_A

Figure 3: Self-Heating in the EX Package Due to Current Flow

Figure 4: Maximum Continuous Current in the EX Package at a Given T_A

The thermal capacity of the ACS711 should be verified by the end user in the application’s specific conditions. The maximum junction temperature, $T_{J(MAX)}$ (165°C), should not be exceeded. Further information on this application testing is available in the [DC and Transient Current Capability application note](#) on the Allegro website.

ASEK711 Evaluation Board Layout

Thermal data shown in Figure 1 and Figure 2 was collected using the ASEK711 Evaluation Board (TED-85-0404-001). This board includes 1500 mm² of 2 oz. copper (0.0694 mm) connected to pins 1 and 2, and to pins 3 and 4, with thermal vias connecting the layers. Top and bottom layers of the PCB are shown below in Figure 5.

Thermal data shown in Figure 3 and Figure 4 was collected using the ASEK711 Evaluation Board (TED-85-0595-001). This board includes 250 mm² of 2 oz. copper (0.0694 mm) connected to pins 1 and 2, and to pins 3 and 4, with thermal vias connecting the layers. Top and bottom layers of the PCB are shown below in Figure 6.

Gerber files for the ASEK711 evaluation board are available for download from the Allegro website. See the technical documents section of the [ACS711 device webpage](#).

For Reference Only; not for tooling use (reference MS-012AA)
Dimensions in millimeters
Dimensions exclusive of mold flash, gate burrs, and dambar protrusions
Exact case and lead configuration at supplier discretion within limits shown

- Terminal #1 mark area
- Branding scale and appearance at supplier discretion
- Reference land pattern layout (reference IPC7351)
- SOIC127P600X175-8M; all pads a minimum of 0.20 mm from all adjacent pads; adjust as necessary to meet application process requirements and PCB layout tolerances

Standard Branding Reference View

N = Device part number
T = Device temperature range
P = Package Designator
A = Amperage
L = Lot number
Belly Brand = Country of Origin

Package EX, 12-Contact QFN With Fused Sensed Current Loop

PCB Layout Reference View

Standard Branding Reference View

N = Device part number
Y = Last two digits of year of manufacture
W = Week of manufacture
L = Lot number

For reference only, not for tooling use (reference JEDEC MO-220WEED except for fused current path)
Dimensions in millimeters
Exact case and lead configuration at supplier discretion within limits shown

Terminal #1 mark area

Fused sensed current path

Reference land pattern layout (reference IPC7351 QFN50P300X300X80-17W4M);

All pads a minimum of 0.20 mm from all adjacent pads; adjust as necessary to meet application process requirements and PCB layout tolerances; when mounting on a multilayer PCB, thermal vias at the exposed thermal pad land can improve thermal dissipation (reference EIA/JEDEC Standard JESD51-5)

Coplanarity includes exposed current path and terminals

Branding scale and appearance at supplier discretion

Revision History

Number	Date	Description
2	July 18, 2013	Update characteristics tables references
3	February 6, 2015	Revised NC description in Terminal List Table
4	June 23, 2017	Added ACS711KEX-15A and ACS711KEX-31AB characteristic performance data plots; Revised product status of ACS711EEXLT-15AB-T and ACS711EEXLT-31AB-T variants to Pre-End-of-Life.
5	January 15, 2021	Added Maximum Continuous Current and ESD Ratings table (page 2), Primary Conductor Inductance and Output Slew Rate (page 4), Frequency Response Plots (page 13), and Thermal Rise vs. Primary Current section (pages 16-17)
