REVISION HISTORY

4/16—Rev. D to Rev. E

Changed CP-20-1 to CP-20-6	Throughout
Changes to Figure 3 and Table 3	7
Moved Figure 4	8
Updated Outline Dimensions	21
Changes to Ordering Guide	21

4/13—Rev. C to Rev. D

Changes to Figure 3 and Table 4.....	7
--------------------------------------	---

12/12—Rev. B to Rev. C

Changes to Table 1	3
Changes to Table 2.....	6
Changes to V _{CCY} Description, Table 3 and Table 4.....	7
Changes to Ordering Guide	20
Added Automotive Products Section	20

12/05—Rev. A to Rev. B

Changes to Table 1	3
Changes to Table 2.....	6
Changes to Figure 3 and Table 4.....	7
Updated Outline Dimensions.....	19
Changes to Ordering Guide	21

6/05—Rev. 0 to Rev. A

Added LFCSP Package.....	Universal
--------------------------	-----------

1/05—Revision 0: Initial Version

SPECIFICATIONS

$V_{CCY} = 1.65\text{ V}$ to 5.5 V , $V_{CCA} = 1.15\text{ V}$ to V_{CCY} , $GND = 0\text{ V}$, $T_A = 25^\circ\text{C}$. All specifications T_{MIN} to T_{MAX} , unless otherwise noted.

Table 1.

Parameter	Symbol	Test Conditions/Comments	B Version ¹			Unit
			Min	Typ	Max	
LOGIC INPUTS/OUTPUTS						
A Side						
Input High Voltage ²	V _{IHA}	V _{CCA} = 1.2 V + 0.1 V/−0.05 V	V _{CCA} × 0.88			V
		V _{CCA} = 1.8 V ± 0.15 V	V _{CCA} × 0.72			V
		V _{CCA} = 2.5 V ± 0.2 V	1.7			V
		V _{CCA} = 3.3 V ± 0.3 V	2.2			V
		V _{CCA} = 5 V ± 0.5 V	V _{CCA} × 0.7			V
Input Low Voltage ²	V _{ILA}	V _{CCA} = 1.2 V + 0.1 V/−0.05 V			V _{CCA} × 0.35	V
		V _{CCA} = 1.8 V ± 0.15 V			V _{CCA} × 0.35	V
		V _{CCA} = 2.5 V ± 0.2 V			0.7	V

¹ T_A for typical specifications is 25°C.² Guaranteed by design, not production tested.

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 2.

Parameter	Rating
V_{CCA} to GND	−0.3 V to +7 V
V_{CCY} to GND	V_{CCA} to +7 V
Digital Inputs (A)	−0.3 V to ($V_{CCA} + 0.3$ V)
Digital Inputs (Y)	−0.3 V to ($V_{CCY} + 0.3$ V)
EN to GND	−0.3 V to +7 V
Operating Temperature Range	−40°C to +85°C
Storage Temperature Range	−65°C to +150°C
Junction Temperature	150°C
θ_{JA} Thermal Impedance (4-Layer Board)	
14-Lead TSSOP	89.21°C/W
12-Ball WLCSP	120°C/W
20-Lead LFCSP	30.4°C/W
Lead Temperature, Soldering	As per JEDEC J-STD-020

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Only one absolute maximum rating can be applied at any one time.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

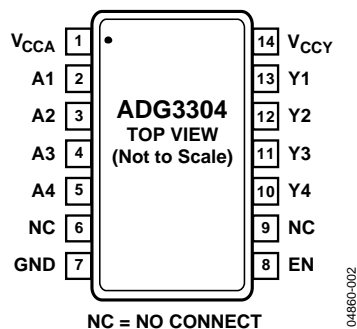

Figure 2. 14-Lead TSSOP Pin Configuration

NOTES
 1. NC = NO CONNECT.
 2. THE EXPOSED PADDLE CAN BE TIED TO GND OR LEFT FLOATING. DO NOT TIE IT TO V_{CCA} OR V_{CCY} .

TERMINOLOGY

V_{IHA}

Logic input high voltage at Pin A1 to Pin A4.

V_{ILA}

Logic input low voltage at Pin A1 to Pin A4.

V_{OHA}

Logic output high voltage at Pin A1 to Pin A4.

V_{OLA}

Logic output low voltage at Pin A1 to Pin A4.

C_A

Capacitance measured at Pin A1 to Pin A4 (EN = 0).

$I_{LA, HI-Z}$

Leakage current at Pin A1 to Pin A4 when EN = 0 (high impedance state at Pin A1 to Pin A4).

V_{IHY}

Logic input high voltage at Pin Y1 to Pin Y4.

V_{ILY}

Logic input low voltage at Pin Y1 to Pin Y4.

V_{OHY}

Logic output high voltage at Pin Y1 to Pin Y4.

V_{OLY}

Logic output low voltage at Pin Y1 to Pin Y4.

C_Y

Capacitance measured at Pin Y1 to Pin Y4 (EN = 0).

$I_{LY, HI-Z}$

Leakage current at Pin Y1 to Pin Y4 when EN = 0 (high impedance state at Pin Y1 to Pin Y4).

V_{IHEN}

Logic input high voltage at the EN pin.

V_{ILEN}

Logic input low voltage at the EN pin.

C_{EN}

Capacitance measured at EN pin.

I_{LEN}

Enable (EN) pin leakage current.

t_{EN}

Three-state enable time for Pin A1 to Pin A4 and Pin Y1 to Pin Y4.

$t_{P, A \rightarrow Y}$

Propagation delay when translating logic levels in the A \rightarrow Y direction.

$t_{R, A \rightarrow Y}$

Rise time when translating logic levels in the A \rightarrow Y direction.

$T_{E, A \rightarrow Y}$

Fall time when translating logic levels in the A \rightarrow Y direction.

$D_{MAX, A \rightarrow Y}$

Guaranteed data rate when translating logic levels in the A \rightarrow Y direction under the driving and loading conditions specified in Table 1.

$T_{SKEW, A \rightarrow Y}$

Difference between propagation delays on any two channels when translating logic levels in the A \rightarrow Y direction.

$t_{PPSKEW, A \rightarrow Y}$

Difference in propagation delay between any one channel and the same channel on a different part (under same driving/loading conditions) when translating in the A \rightarrow Y direction.

$t_{P, Y \rightarrow A}$

Propagation delay when translating logic levels in the Y \rightarrow A direction.

$t_{R, Y \rightarrow A}$

Rise time when translating logic levels in the Y \rightarrow A direction.

$t_{F, Y \rightarrow A}$

Fall time when translating logic levels in the Y \rightarrow A direction.

$D_{MAX, Y \rightarrow A}$

Guaranteed data rate when translating logic levels in the Y \rightarrow A direction under the driving and loading conditions specified in Table 1.

$T_{SKEW, Y \rightarrow A}$

Difference between propagation delays on any two channels when translating logic levels in the Y \rightarrow A direction.

$t_{PPSKEW, Y \rightarrow A}$

Difference in propagation delay between any one channel and the same channel on a different part (under the same driving/loading conditions) when translating in the Y \rightarrow A direction.

V_{CCA}

V_{CCA} supply voltage.

V_{CCY}

V_{CCY} supply voltage.

I_{CCA}

V_{CCA} supply current.

I_{CCY}

V_{CCY} supply current.

$I_{HI-Z, A}$

V_{CCA} supply current during three-state mode (EN = 0).

$I_{HI-Z, Y}$

V_{CCY} supply current during three-state mode (EN = 0).

THEORY OF OPERATION

The **ADG3304** level translator allows the level shifting necessary for data transfer in a system where multiple supply voltages are used. The device requires two supplies, V_{CCA} and V_{CCY} ($V_{CCA} \leq V_{CCY}$). These supplies set the logic levels on each side of the device. When driving the A pins, the device translates the V_{CCA} -compatible logic levels to V_{CCY} -compatible logic levels available at the Y pins. Similarly, because the device is capable of bidirectional translation, when driving the Y pins, the V_{CCY} -compatible logic levels are translated to V_{CCA} -compatible logic levels available at the A pins. When $EN = 0$, Pin A1 to Pin A4 and Pin Y1 to Pin Y4 are three-stated. When EN is driven high, the **ADG3304** goes into normal operation mode and performs level translation.

LEVEL TRANSLATOR ARCHITECTURE

The **ADG3304** consists of four bidirectional channels. Each channel can translate logic levels in either the $A \rightarrow Y$ or the $Y \rightarrow A$ direction. It uses a one-shot accelerator architecture, which ensures excellent switching characteristics. Figure 39 shows a simplified block diagram of a bidirectional channel.

Figure 39. Simplified Block Diagram of an **ADG3304** Channel

The logic level translation in the $A \rightarrow Y$ direction is performed using a level translator (U1) and an inverter (U2), while the translation in the $Y \rightarrow A$ direction is performed using Inverter U3 and Inverter U4. The one-shot generator detects a rising or falling edge present on either the A side or the Y side of the channel. It sends a short pulse that turns on the PMOS transistors (T1 to T2) for a rising edge, or the NMOS transistors (T3 to T4) for a falling edge. This charges/discharges the capacitive load faster, which results in faster rise and fall times.

The inputs of the unused channels (A or Y) should be tied to their corresponding V_{CC} rail (V_{CCA} or V_{CCY}) or to GND.

INPUT DRIVING REQUIREMENTS

To ensure correct operation of the **ADG3304**, the circuit that drives the input of the **ADG3304** channels should have an output impedance of less than or equal to $150\ \Omega$ and a minimum peak current driving capability of 36 mA.

OUTPUT LOAD REQUIREMENTS

The **ADG3304** level translator is designed to drive CMOS-compatible loads. If current-driving capability is required, it is recommended to use buffers between the **ADG3304** outputs and the load.

ENABLE OPERATION

The **ADG3304** provides three-state operation at the A and Y I/O pins by using the enable pin (EN), as shown in Table 5.

Table 5. Truth Table

EN	Y I/O Pins	A I/O Pins
0	Hi-Z ¹	Hi-Z ¹
1	Normal operation ²	Normal operation ²

¹ High impedance state.

² In normal operation, the **ADG3304** performs level translation.

While $EN = 0$, the **ADG3304** enters into three-state mode. In this mode, the current consumption from both the V_{CCA} and V_{CCY} supplies is reduced, allowing the user to save power, which is critical, especially on battery-operated systems. The EN input pin can be driven with either V_{CCA} -compatible or V_{CCY} -compatible logic levels.

POWER SUPPLIES

For proper operation of the **ADG3304**, the voltage applied to the V_{CCA} must be less than or equal to the voltage applied to V_{CCY} . To meet this condition, the recommended power-up sequence is V_{CCY} first and then V_{CCA} . The **ADG3304** operates properly only after both supply voltages reach their nominal values. It is not recommended to use the part in a system where, during power-up, V_{CCA} can be greater than V_{CCY} due to a significant increase in the current taken from the V_{CCA} supply. For optimum performance, the V_{CCA} pin and V_{CCY} pin should be decoupled to GND as close as possible to the device.

DATA RATE

The maximum data rate at which the device is guaranteed to operate is a function of the V_{CCA} and V_{CCY} supply voltage combination and the load capacitance. It is given by the maximum frequency of a square wave that can be applied to the device, which meets the V_{OH} and V_{OL} levels at the output and does not exceed the maximum junction temperature (see the Absolute Maximum Ratings section). Table 6 shows the guaranteed data rates at which the **ADG3304** can operate in both directions (A→Y or Y→A level translation) for various V_{CCA} and V_{CCY} supply combinations.

Table 6. Guaranteed Data Rate (Mbps)¹

V_{CCA}	V_{CCY}			
	1.8 V (1.65 V to 1.95 V)	2.5 V (2.3 V to 2.7 V)	3.3 V (3.0 V to 3.6 V)	5 V (4.5 V to 5.5 V)
1.2 V (1.15 V to 1.3 V)	25	30	40	40
1.8 V (1.65 V to 1.95 V)	-	45	50	50
2.5 V (2.3 V to 2.7 V)	-	-	60	50
3.3 V (3.0 V to 3.6 V)	-	-	-	50
5 V (4.5 V to 5.5 V)	-	-	-	-

¹ The load capacitance used is 50 pF when translating in the A→Y direction and 15 pF when translating in the Y→A direction.

APPLICATIONS INFORMATION

The **ADG3304** is designed for digital circuits that operate at different supply voltages; therefore, logic level translation is required. The lower voltage logic signals are connected to the A pins, and the higher voltage logic signals are connected to the Y pins. The **ADG3304** can provide level translation in both directions from A→Y or Y→A on all four channels, eliminating the need for a level translator IC for each direction. The internal architecture allows the **ADG3304** to perform bidirectional level translation without an additional signal to set the direction in which the translation is made. It also allows simultaneous data flow in both directions on the same part, for example, when two channels translate in A→Y direction while the other two translate in Y→A direction. This simplifies the design by eliminating the timing requirements for the direction signal and reducing the number of ICs used for level translation.

Figure 40 shows an application where two microprocessors operating at 1.8 V and 3.3 V, respectively, can transfer data simultaneously using two full-duplex serial links, TX1/RX1 and TX2/RX2.

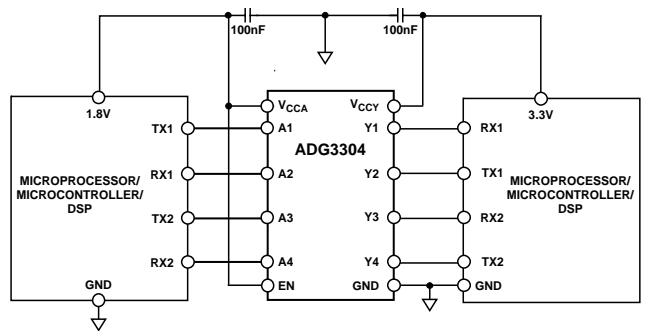

Figure 40. 1.8 V to 3.3 V Level Translation Circuit on Two Full-Duplex Serial Links

When the application requires level translation between a microprocessor and multiple peripheral devices, the **ADG3304** I/O pins can be three-stated by setting EN = 0. This feature allows the **ADG3304** to share the data buses with other devices without causing contention issues. Figure 41 shows an application where a 1.8 V microprocessor is connected to a 3.3 V peripheral device using the three-state feature.

LAYOUT GUIDELINES

As with any high speed digital IC, the printed circuit board layout is important for the overall performance of the circuit. Care should be taken to ensure proper power supply bypass and return paths for the high speed signals. Each V_{CC} pin (V_{CCA} and V_{CCY}) should be bypassed using low effective series resistance (ESR) and effective series inductance (ESI) capacitors placed as close as possible to the V_{CCA} pin and the V_{CCY} pin. The parasitic inductance of the high speed signal track may cause significant overshoot. This effect can be reduced by keeping the length of the tracks as short as possible. A solid copper plane for the return path (GND) is also recommended.

¹ Z = RoHS Compliant Part.

² W = Qualified for Automotive Applications.

³ Branding on these packages is limited to three characters due to space constraints.

AUTOMOTIVE PRODUCTS

The [ADG3304W](#) model is available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that this automotive model may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.
