

## 2. Pin Configurations

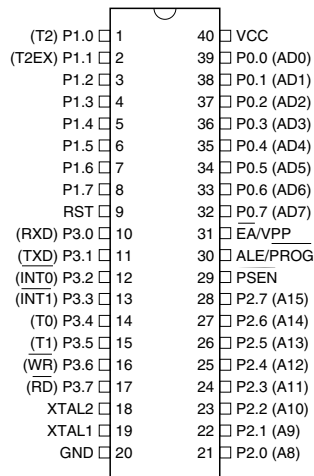

### 2.1 44A – 44-lead TQFP

### 2.2 44J – 44-lead PLCC

### 2.3 40P6 – 40-lead PDIP

### 3. Block Diagram

## 4. Pin Description

### 4.1 VCC

Supply voltage.

### 4.2 GND

Ground.

### 4.3 Port 0

Port 0 is an 8-bit open drain bi-directional I/O port. As an output port, each pin can sink eight TTL inputs. When 1s are written to port 0 pins, the pins can be used as high-impedance inputs.

Port 0 can also be configured to be the multiplexed low-order address/data bus during accesses to external program and data memory. In this mode, P0 has internal pull-ups.

Port 0 also receives the code bytes during Flash programming and outputs the code bytes during program verification. **External pull-ups are required during program verification.**

### 4.4 Port 1

Port 1 is an 8-bit bi-directional I/O port with internal pull-ups. The Port 1 output buffers can sink/source four TTL inputs. When 1s are written to Port 1 pins, they are pulled high by the internal pull-ups and can be used as inputs. As inputs, Port 1 pins that are externally being pulled low will source current ( $I_{IL}$ ) because of the internal pull-ups.

In addition, P1.0 and P1.1 can be configured to be the timer/counter 2 external count input (P1.0/T2) and the timer/counter 2 trigger input (P1.1/T2EX), respectively, as shown in the following table.

Port 1 also receives the low-order address bytes during Flash programming and verification.

Port Pin	Alternate Functions
P1.0	T2 (external count input to Timer/Counter 2), clock-out
P1.1	T2EX (Timer/Counter 2 capture/reload trigger and direction control)

### 4.5 Port 2

Port 2 is an 8-bit bi-directional I/O port with internal pull-ups. The Port 2 output buffers can sink/source four TTL inputs. When 1s are written to Port 2 pins, they are pulled high by the internal pull-ups and can be used as inputs. As inputs, Port 2 pins that are externally being pulled low will source current ( $I_{IL}$ ) because of the internal pull-ups.

Port 2 emits the high-order address byte during fetches from external program memory and during accesses to external data memory that use 16-bit addresses (MOVX @ DPTR). In this application, Port 2 uses strong internal pull-ups when emitting 1s. During accesses to external data memory that use 8-bit addresses (MOVX @ RI), Port 2 emits the contents of the P2 Special Function Register.

Port 2 also receives the high-order address bits and some control signals during Flash programming and verification.

## 4.6 Port 3

Port 3 is an 8-bit bi-directional I/O port with internal pull-ups. The Port 3 output buffers can sink/source four TTL inputs. When 1s are written to Port 3 pins, they are pulled high by the internal pull-ups and can be used as inputs. As inputs, Port 3 pins that are externally being pulled low will source current ( $I_{IL}$ ) because of the pull-ups.

Port 3 receives some control signals for Flash programming and verification.

Port 3 also serves the functions of various special features of the AT89C55WD, as shown in the following table.

Port Pin	Alternate Functions
P3.0	RXD (serial input port)
P3.1	TXD (serial output port)
P3.2	$\overline{\text{INT0}}$ (external interrupt 0)
P3.3	$\overline{\text{INT1}}$ (external interrupt 1)
P3.4	T0 (timer 0 external input)
P3.5	T1 (timer 1 external input)
P3.6	$\overline{\text{WR}}$ (external data memory write strobe)
P3.7	$\overline{\text{RD}}$ (external data memory read strobe)

## 4.7 RST

Reset input. A high on this pin for two machine cycles while the oscillator is running resets the device. This pin drives High for 98 oscillator periods after the Watchdog times out. The DISRTO bit in SFR AUXR (address 8EH) can be used to disable this feature. In the default state of bit DISRTO, the RESET HIGH out feature is enabled.

## 4.8 ALE/ $\overline{\text{PROG}}$

Address Latch Enable is an output pulse for latching the low byte of the address during accesses to external memory. This pin is also the program pulse input ( $\overline{\text{PROG}}$ ) during Flash programming.

In normal operation, ALE is emitted at a constant rate of 1/6 the oscillator frequency and may be used for external timing or clocking purposes. Note, however, that one ALE pulse is skipped during each access to external data memory.

If desired, ALE operation can be disabled by setting bit 0 of SFR location 8EH. With the bit set, ALE is active only during a MOVX or MOVC instruction. Otherwise, the pin is weakly pulled high. Setting the ALE-disable bit has no effect if the microcontroller is in external execution mode.

## 4.9 $\overline{\text{PSEN}}$

Program Store Enable is the read strobe to external program memory.

When the AT89C55WD is executing code from external program memory,  $\overline{\text{PSEN}}$  is activated twice each machine cycle, except that two  $\overline{\text{PSEN}}$  activations are skipped during each access to external data memory.

## 4.10 $\overline{EA}/VPP$

External Access Enable.  $\overline{EA}$  must be strapped to GND in order to enable the device to fetch code from external program memory locations starting at 0000H up to FFFFH. Note, however, that if lock bit 1 is programmed,  $\overline{EA}$  will be internally latched on reset.

$\overline{EA}$  should be strapped to  $V_{CC}$  for internal program executions.

This pin also receives the 12V programming enable voltage ( $V_{PP}$ ) during Flash programming.

## 4.11 XTAL1

Input to the inverting oscillator amplifier and input to the internal clock operating circuit.

## 4.12 XTAL2

Output from the inverting oscillator amplifier.

# 5. Special Function Registers

A map of the on-chip memory area called the Special Function Register (SFR) space is shown in [Table 5-1](#).

**Table 5-1.** AT89C55WD SFR Map and Reset Values

0F8H								0FFH
0F0H	B 00000000							0F7H
0E8H								0EFH
0E0H	ACC 00000000							0E7H
0D8H								0DFH
0D0H	PSW 00000000							0D7H
0C8H	T2CON 00000000	T2MOD XXXXXX00	RCAP2L 00000000	RCAP2H 00000000	TL2 00000000	TH2 00000000		0CFH
0C0H								0C7H
0B8H	IP XX000000							0BFH
0B0H	P3 11111111							0B7H
0A8H	IE 0X000000							0AFH
0A0H	P2 11111111		AUXR1 XXXXXXX0				WDTRST XXXXXXXX	0A7H
98H	SCON 00000000	SBUF XXXXXXXX						9FH
90H	P1 11111111							97H
88H	TCON 00000000	TMOD 00000000	TL0 00000000	TL1 00000000	TH0 00000000	TH1 00000000	AUXR XXX00XX0	8FH
80H	P0 11111111	SP 00000111	DP0L 00000000	DP0H 00000000	DP1L 00000000	DP1H 00000000	PCON 0XXX0000	87H

Note that not all of the addresses are occupied, and unoccupied addresses may not be implemented on the chip. Read accesses to these addresses will in general return random data, and write accesses will have an indeterminate effect.

User software should not write 1s to these unlisted locations, since they may be used in future products to invoke new features. In that case, the reset or inactive values of the new bits will always be 0.

**Timer 2 Registers:** Control and status bits are contained in registers T2CON (shown in Table 5-2) and T2MOD (shown in Table 5-2) for Timer 2. The register pair (RCAP2H, RCAP2L) are the Capture/Reload registers for Timer 2 in 16-bit capture mode or 16-bit auto-reload mode.

**Interrupt Registers:** The individual interrupt enable bits are in the IE register. Two priorities can be set for each of the six interrupt sources in the IP register.

**Dual Data Pointer Registers:** To facilitate accessing both internal and external data memory, two banks of 16-bit Data Pointer Registers are provided: DP0 at SFR address locations 82H-83H and DP1 at 84H-85H. Bit DPS = 0 in SFR AUXR1 selects DP0 and DPS = 1 selects DP1. The user should always initialize the DPS bit to the appropriate value before accessing the respective Data Pointer Register.

**Power Off Flag:** The Power Off Flag (POF) is located at bit 4 (PCON.4) in the PCON SFR. POF is set to “1” during power up. It can be set and reset under software control and is not affected by reset.

**Table 5-2.** T2CON—Timer/Counter 2 Control Register

T2CON Address = 0C8H					Reset Value = 0000 0000B			
Bit Addressable								
Bit	TF2	EXF2	RCLK	TCLK	EXEN2	TR2	C/ $\overline{T}2$	CP/ $\overline{RL}2$
	7	6	5	4	3	2	1	0

Symbol	Function
TF2	Timer 2 overflow flag set by a Timer 2 overflow and must be cleared by software. TF2 will not be set when either RCLK = 1 or TCLK = 1.
EXF2	Timer 2 external flag set when either a capture or reload is caused by a negative transition on T2EX and EXEN2 = 1. When Timer 2 interrupt is enabled, EXF2 = 1 will cause the CPU to vector to the Timer 2 interrupt routine. EXF2 must be cleared by software. EXF2 does not cause an interrupt in up/down counter mode (DCEN = 1).
RCLK	Receive clock enable. When set, causes the serial port to use Timer 2 overflow pulses for its receive clock in serial port Modes 1 and 3. RCLK = 0 causes Timer 1 overflow to be used for the receive clock.
TCLK	Transmit clock enable. When set, causes the serial port to use Timer 2 overflow pulses for its transmit clock in serial port Modes 1 and 3. TCLK = 0 causes Timer 1 overflows to be used for the transmit clock.
EXEN2	Timer 2 external enable. When set, allows a capture or reload to occur as a result of a negative transition on T2EX if Timer 2 is not being used to clock the serial port. EXEN2 = 0 causes Timer 2 to ignore events at T2EX.
TR2	Start/Stop control for Timer 2. TR2 = 1 starts the timer.
C/ $\overline{T}2$	Timer or counter select for Timer 2. C/ $\overline{T}2$ = 0 for timer function. C/ $\overline{T}2$ = 1 for external event counter (falling edge triggered).
CP/ $\overline{RL}2$	Capture/Reload select. CP/ $\overline{RL}2$ = 1 causes captures to occur on negative transitions at T2EX if EXEN2 = 1. CP/ $\overline{RL}2$ = 0 causes automatic reloads to occur when Timer 2 overflows or negative transitions occur at T2EX when EXEN2 = 1. When either RCLK or TCLK = 1, this bit is ignored and the timer is forced to auto-reload on Timer 2 overflow.

## 6. Memory Organization

The MCS-51 devices have a separate address space for Program and Data Memory. Up to 64 Kbytes each of external Program and Data Memory can be addressed.

### 6.1 Program Memory

If the  $\overline{EA}$  pin is connected to GND, all program fetches are directed to external memory.

On the AT89C55WD, if  $\overline{EA}$  is connected to  $V_{CC}$ , program fetches to addresses 0000H through 4FFFH are directed to internal memory and fetches to addresses 5000H through FFFFH are to external memory.

### 6.2 Data Memory

The AT89C55WD implements 256 bytes of on-chip RAM. The upper 128 bytes occupy a parallel address space to the Special Function Registers. That means the upper 128 bytes have the same addresses as the SFR space but are physically separate from SFR space.

When an instruction accesses an internal location above address 7FH, the address mode used in the instruction specifies whether the CPU accesses the upper 128 bytes of RAM or the SFR space. Instructions that use direct addressing access SFR space.

For example, the following direct addressing instruction accesses the SFR at location 0A0H (which is P2).

```
MOV 0A0H, #data
```

Instructions that use indirect addressing access the upper 128 bytes of RAM. For example, the following indirect addressing instruction, where R0 contains 0A0H, accesses the data byte at address 0A0H, rather than P2 (whose address is 0A0H).

```
MOV @R0, #data
```

Note that stack operations are examples of indirect addressing, so the upper 128 bytes of data RAM are available as stack space.

## 7. Hardware Watchdog Timer (One-time Enabled with Reset-out)

The WDT is intended as a recovery method in situations where the CPU may be subjected to software upsets. The WDT consists of a 13-bit counter and the WatchDog Timer Reset (WDTRST) SFR. The WDT is defaulted to disable from exiting reset. To enable the WDT, a user must write 01EH and 0E1H in sequence to the WDTRST register (SFR location 0A6H). When the WDT is enabled, it will increment every machine cycle while the oscillator is running. The WDT time-out period is dependent on the external clock frequency. There is no way to disable the WDT except through reset (either hardware reset or WDT overflow reset). When WDT overflows, it will drive an output RESET HIGH pulse at the RST pin.

## 8. Using the WDT

To enable the WDT, a user must write 01EH and 0E1H in sequence to the WDTRST register (SFR location 0A6H). When the WDT is enabled, the user needs to service it by writing 01EH and 0E1H to WDTRST to avoid a WDT overflow. The 13-bit counter overflows when it reaches 8191 (1FFFH), and this will reset the device. When the WDT is enabled, it will increment every machine cycle while the oscillator is running. This means the user must re-initialize the WDT at least every 8191 machine cycles. To re-initialize the WDT the user must write 01EH and 0E1H to WDTRST. WDTRST is a write-only register. The WDT counter cannot be read or written. When WDT overflows, it will generate an output RESET pulse at the RST pin. The RESET pulse duration is  $98 \times TOSC$ , where  $TOSC = 1/FOSC$ . To make the best use of the WDT, it should be serviced in those sections of code that will periodically be executed within the time required to prevent a WDT reset.

## 9. WDT During Power-down and Idle

In Power-down mode the oscillator stops, which means the WDT also stops. While in Power-down mode, the user does not need to service the WDT. There are two methods of exiting Power-down mode: by a hardware reset or via a level-activated external interrupt which is enabled prior to entering Power-down mode. When Power-down is exited with hardware reset, servicing the WDT should occur as it normally does whenever the AT89C55WD is reset. Exiting Power-down with an interrupt is significantly different. The interrupt is held low long enough for the oscillator to stabilize. When the interrupt is brought high, the interrupt is serviced. To prevent the WDT from resetting the device while the interrupt pin is held low, the WDT is not started until the interrupt is pulled high. It is suggested that the WDT be reset during the interrupt service for the interrupt used to exit Power-down.

To ensure that the WDT does not overflow within a few states of exiting Power-down, it is best to reset the WDT just before entering Power-down.

Before going into the IDLE mode, the WDIDLE bit in SFR AUXR is used to determine whether the WDT continues to count if enabled. The WDT keeps counting during IDLE (WDIDLE bit = 0) as the default state. To prevent the WDT from resetting the AT89C55WD while in IDLE mode, the user should always set up a timer that will periodically exit IDLE, service the WDT, and re-enter IDLE mode.

With WDIDLE bit enabled, the WDT will stop to count in IDLE mode and resumes the count upon exit from IDLE.

## 10. UART

The UART in the AT89C55WD operates the same way as the UART in the AT89C51 and AT89C52. For more detailed information on the UART operation, please click on the document link below:

[http://www.atmel.com/dyn/resources/prod\\_documents/DOC4316.PDF](http://www.atmel.com/dyn/resources/prod_documents/DOC4316.PDF)

## 11. Timer 0 and 1

Timer 0 and Timer 1 in the AT89C55WD operate the same way as Timer 0 and Timer 1 in the AT89C51 and AT89C52. For further information on the timers' operation, please click on the document link below:

[http://www.atmel.com/dyn/resources/prod\\_documents/DOC4316.PDF](http://www.atmel.com/dyn/resources/prod_documents/DOC4316.PDF)

## 12. Timer 2

Timer 2 is a 16-bit Timer/Counter that can operate as either a timer or an event counter. The type of operation is selected by bit  $C/\overline{T}2$  in the SFR T2CON (shown in [Table 5-2](#)). Timer 2 has three operating modes: capture, auto-reload (up or down counting), and baud rate generator. The modes are selected by bits in T2CON, as shown in [Table 5-2](#).

Timer 2 consists of two 8-bit registers, TH2 and TL2. In the Timer function, the TL2 register is incremented every machine cycle. Since a machine cycle consists of 12 oscillator periods, the count rate is 1/12 of the oscillator frequency.

**Table 12-1.** Timer 2 Operating Modes

RCLK +TCLK	CP/ $\overline{RL}2$	TR2	MODE
0	0	1	16-bit Auto-Reload
0	1	1	16-bit Capture
1	X	1	Baud Rate Generator
X	X	0	(Off)

In the Counter function, the register is incremented in response to a 1-to-0 transition at its corresponding external input pin, T2. In this function, the external input is sampled during S5P2 of every machine cycle. When the samples show a high in one cycle and a low in the next cycle, the count is incremented. The new count value appears in the register during S3P1 of the cycle following the one in which the transition was detected. Since two machine cycles (24 oscillator periods) are required to recognize a 1-to-0 transition, the maximum count rate is 1/24 of the oscillator frequency. To ensure that a given level is sampled at least once before it changes, the level should be held for at least one full machine cycle.

### 12.1 Capture Mode

In the capture mode, two options are selected by bit EXEN2 in T2CON. If EXEN2 = 0, Timer 2 is a 16-bit timer or counter which upon overflow sets bit TF2 in T2CON. This bit can then be used to generate an interrupt. If EXEN2 = 1, Timer 2 performs the same operation, but a 1-to-0 transition at external input T2EX also causes the current value in TH2 and TL2 to be captured into RCAP2H and RCAP2L, respectively. In addition, the transition at T2EX causes bit EXF2 in T2CON to be set. The EXF2 bit, like TF2, can generate an interrupt. The capture mode is illustrated in [Figure 12-1](#).

### 12.2 Auto-reload (Up or Down Counter)

Timer 2 can be programmed to count up or down when configured in its 16-bit auto-reload mode. This feature is invoked by the DCEN (Down Counter Enable) bit located in the SFR T2MOD (see [Table 12-2](#)). Upon reset, the DCEN bit is set to 0 so that timer 2 will default to count up. When DCEN is set, Timer 2 can count up or down, depending on the value of the T2EX pin.

The diagram illustrates the internal logic of the Timer 2 peripheral. It starts with an oscillator (OSC) connected to a 12x divider ( $\div 12$ ). The output of the divider is split into two paths based on the  $C/\overline{T2}$  control signal. When  $C/\overline{T2} = 0$ , the signal passes through the TR2 register to the TH2 and TL2 registers, and then to the TF2 (Timer Flag 2) register. When  $C/\overline{T2} = 1$ , the signal is captured by the transition detector and the EXEN2 register, which then triggers the EXF2 (Extended Flag 2) register. Both the TF2 and EXF2 registers are inputs to an OR gate, which generates the TIMER 2 INTERRUPT signal. The diagram also shows the T2 PIN and T2EX PIN inputs, and the RCAP2H and RCAP2L registers, which are connected to the TH2 and TL2 registers via a capture input.

Setting the DCEN bit enables Timer 2 to count up or down, as shown in [Figure 12-2](#). In this mode, the T2EX pin controls the direction of the count. A logic 1 at T2EX makes Timer 2 count up. The timer will overflow at 0FFFFH and set the TF2 bit. This overflow also causes the 16-bit value in RCAP2H and RCAP2L to be reloaded into the timer registers, TH2 and TL2, respectively.

The EXF2 bit toggles whenever Timer 2 overflows or underflows and can be used as a 17th bit of resolution. In this operating mode, EXF2 does not flag an interrupt.

The diagram illustrates the internal structure of the Timer 2 peripheral. It features two main input paths: one for the clock signal and another for the external event input.

- Clock Path:** The clock signal (OSC) is divided by 12 ( $\div 12$ ) and then passes through a switch controlled by  $C/\overline{T2} = 0$ . This switch is also controlled by the  $C/\overline{T2} = 1$  signal, which is derived from the T2 PIN.
- External Event Path:** The external event input (T2EX PIN) passes through a transition detector and then through a switch controlled by  $EXEN2$ .
- Counter and Registers:** The outputs of the switches are connected to the TH2 (Timer High) and TL2 (Timer Low) registers. These registers are also connected to the RCAP2H and RCAP2L (Reload Capture) registers. The TH2 and TL2 registers are also connected to the TF2 (Timer Flag) and EXF2 (External Event Flag) registers.
- Control and Status:** The TH2 and TL2 registers are controlled by the TR2 (Timer Reload) signal. The TF2 and EXF2 registers are connected to the RELOAD signal, which is also connected to the RCAP2H and RCAP2L registers. The TF2 and EXF2 registers are also connected to the OVERFLOW signal.
- Interrupts:** The TF2 and EXF2 registers are connected to the TIMER 2 INTERRUPT signal.

**Table 12-2.** T2MOD – Timer 2 Mode Control Register

T2OE	Timer 2 Output Enable bit
DCEN	When set, this bit allows Timer 2 to be configured as an up/down counter

**Figure 12-3.** Timer 2 Auto Reload Mode (DCEN = 1)

## 13. Baud Rate Generator

Timer 2 is selected as the baud rate generator by setting TCLK and/or RCLK in T2CON (Table 5-2). Note that the baud rates for transmit and receive can be different if Timer 2 is used for the receiver or transmitter and Timer 1 is used for the other function. Setting RCLK and/or TCLK puts Timer 2 into its baud rate generator mode, as shown in Figure 13-1.

The baud rate generator mode is similar to the auto-reload mode, in that a rollover in TH2 causes the Timer 2 registers to be reloaded with the 16-bit value in registers RCAP2H and RCAP2L, which are preset by software.

The baud rates in Modes 1 and 3 are determined by Timer 2's overflow rate according to the following equation.

$$\text{Modes 1 and 3 Baud Rates} = \frac{\text{Timer 2 Overflow Rate}}{16}$$

The Timer can be configured for either timer or counter operation. In most applications, it is configured for timer operation ( $CP/\overline{T2} = 0$ ). The timer operation is different for Timer 2 when it is used as a baud rate generator. Normally, as a timer, it increments every machine cycle (at 1/12 the oscillator frequency). As a baud rate generator, however, it increments every state time (at 1/2 the oscillator frequency). The baud rate formula is given below.

$$\frac{\text{Modes 1 and 3}}{\text{Baud Rate}} = \frac{\text{Oscillator Frequency}}{32 \times [65536 - \text{RCAP2H}, \text{RCAP2L}]}$$

where (RCAP2H, RCAP2L) is the content of RCAP2H and RCAP2L taken as a 16-bit unsigned integer.

Timer 2 as a baud rate generator is shown in Figure 13-1. This figure is valid only if RCLK or TCLK = 1 in T2CON. Note that a rollover in TH2 does not set TF2 and will not generate an interrupt. Note too, that if EXEN2 is set, a 1-to-0 transition in T2EX will set EXF2 but will not cause a reload from (RCAP2H, RCAP2L) to (TH2, TL2). Thus when Timer 2 is in use as a baud rate generator, T2EX can be used as an extra external interrupt.

Note that when Timer 2 is running (TR2 = 1) as a timer in the baud rate generator mode, TH2 or TL2 should not be read from or written to. Under these conditions, the Timer is incremented every state time, and the results of a read or write may not be accurate. The RCAP2 registers may be read but should not be written to, because a write might overlap a reload and cause write and/or reload errors. The timer should be turned off (clear TR2) before accessing the Timer 2 or RCAP2 registers.

Figure 13-1. Timer 2 in Baud Rate Generator Mode

## 14. Programmable Clock Out

A 50% duty cycle clock can be programmed to come out on P1.0, as shown in Figure 14-1. This pin, besides being a regular I/O pin, has two alternate functions. It can be programmed to input the external clock for Timer/Counter 2 or to output a 50% duty cycle clock ranging from 61 Hz to 4 MHz for a 16 MHz operating frequency.

To configure the Timer/Counter 2 as a clock generator, bit  $\overline{C/T2}$  (T2CON.1) must be cleared and bit T2OE (T2MOD.1) must be set. Bit TR2 (T2CON.2) starts and stops the timer.

The clock-out frequency depends on the oscillator frequency and the reload value of Timer 2 capture registers (RCAP2H, RCAP2L), as shown in the following equation.

$$\text{Clock-Out Frequency} = \frac{\text{Oscillator Frequency}}{4 \times [65536 - (\text{RCAP2H}, \text{RCAP2L})]}$$

In the clock-out mode, Timer 2 roll-overs will not generate an interrupt. This behavior is similar to when Timer 2 is used as a baud-rate generator. It is possible to use Timer 2 as a baud-rate generator and a clock generator simultaneously. Note, however, that the baud-rate and clock-out frequencies cannot be determined independently from one another since they both use RCAP2H and RCAP2L.

**Figure 14-1.** Timer 2 in Clock-Out Mode

## 15. Interrupts

The AT89C55WD has a total of six interrupt vectors: two external interrupts ( $\overline{\text{INT0}}$  and  $\overline{\text{INT1}}$ ), three timer interrupts (Timers 0, 1, and 2), and the serial port interrupt. These interrupts are all shown in [Figure 15-1](#).

Each of these interrupt sources can be individually enabled or disabled by setting or clearing a bit in Special Function Register IE. IE also contains a global disable bit, EA, which disables all interrupts at once.

Note that Table 5 shows that bit position IE.6 is unimplemented. User software should not write a '1' to this bit position, since it may be used in future AT89 products.

Timer 2 interrupt is generated by the logical OR of bits TF2 and EXF2 in register T2CON. Neither of these flags is cleared by hardware when the service routine is vectored to. In fact, the service routine may have to determine whether it was TF2 or EXF2 that generated the interrupt, and that bit will have to be cleared in software.

The Timer 0 and Timer 1 flags, TF0 and TF1, are set at S5P2 of the cycle in which the timers overflow. The values are then polled by the circuitry in the next cycle. However, the Timer 2 flag, TF2, is set at S2P2 and is polled in the same cycle in which the timer overflows.

**Table 15-1.** Interrupt Enable (IE) Register

(MSB)				(LSB)			
EA	–	ET2	ES	ET1	EX1	ET0	EX0
Enable Bit = 1 enables the interrupt.							
Enable Bit = 0 disables the interrupt.							

Symbol	Position	Function
EA	IE.7	Disables all interrupts. If EA = 0, no interrupt is acknowledged. If EA = 1, each interrupt source is individually enabled or disabled by setting or clearing its enable bit.
–	IE.6	Reserved.
ET2	IE.5	Timer 2 interrupt enable bit.
ES	IE.4	Serial Port interrupt enable bit.
ET1	IE.3	Timer 1 interrupt enable bit.
EX1	IE.2	External interrupt 1 enable bit.
ET0	IE.1	Timer 0 interrupt enable bit.
EX0	IE.0	External interrupt 0 enable bit.

User software should never write 1s to reserved bits, because they may be used in future AT89 products.

**Figure 15-1.** Interrupt Sources

## 16. Oscillator Characteristics

XTAL1 and XTAL2 are the input and output, respectively, of an inverting amplifier that can be configured for use as an on-chip oscillator, as shown in [Figure 18-1](#). Either a quartz crystal or ceramic resonator may be used. To drive the device from an external clock source, XTAL2 should be left unconnected while XTAL1 is driven, as shown in [Figure 18-2](#). There are no requirements on the duty cycle of the external clock signal, since the input to the internal clocking circuitry is through a divide-by-two flip-flop, but minimum and maximum voltage high and low time specifications must be observed.

## 17. Idle Mode

In idle mode, the CPU puts itself to sleep while all the on-chip peripherals remain active. The mode is invoked by software. The content of the on-chip RAM and all the special functions registers remain unchanged during this mode. The idle mode can be terminated by any enabled interrupt or by a hardware reset.

Note that when idle mode is terminated by a hardware reset, the device normally resumes program execution from where it left off, up to two machine cycles before the internal reset algorithm takes control. On-chip hardware inhibits access to internal RAM in this event, but access to the port pins is not inhibited. To eliminate the possibility of an unexpected write to a port pin when idle mode is terminated by a reset, the instruction following the one that invokes idle mode should not write to a port pin or to external memory.

## 18. Power-down Mode

In the Power-down mode, the oscillator is stopped, and the instruction that invokes Power-down is the last instruction executed. The on-chip RAM and Special Function Registers retain their values until the Power-down mode is terminated. Exit from Power-down can be initiated either by a hardware reset or by an enabled external interrupt. Reset redefines the SFRs but does not change the on-chip RAM. The reset should not be activated before  $V_{CC}$  is restored to its normal operating level and must be held active long enough to allow the oscillator to restart and stabilize.

**Figure 18-1.** Oscillator Connections

Note: C1, C2 = 30 pF ± 10 pF for Crystals  
 = 40 pF ± 10 pF for Ceramic Resonators

**Figure 18-2.** External Clock Drive Configuration

**Table 18-1.** Status of External Pins During Idle and Power-down Modes

Mode	Program Memory	ALE	$\overline{\text{PSEN}}$	PORT0	PORT1	PORT2	PORT3
Idle	Internal	1	1	Data	Data	Data	Data
Idle	External	1	1	Float	Data	Address	Data
Power-down	Internal	0	0	Data	Data	Data	Data
Power-down	External	0	0	Float	Data	Data	Data

## 19. Program Memory Lock Bits

The AT89C55WD has three lock bits that can be left unprogrammed (U) or can be programmed (P) to obtain the additional features listed in the following table.

**Table 19-1.** Lock Bit Protection Modes

Program Lock Bits				Protection Type
	LB1	LB2	LB3	
1	U	U	U	No program lock features.
2	P	U	U	MOVC instructions executed from external program memory are disabled from fetching code bytes from internal memory, $\overline{EA}$ is sampled and latched on reset, and further programming of the Flash memory is disabled.
3	P	P	U	Same as mode 2, but verify is also disabled.
4	P	P	P	Same as mode 3, but external execution is also disabled.

When lock bit 1 is programmed, the logic level at the  $\overline{EA}$  pin is sampled and latched during reset. If the device is powered up without a reset, the latch initializes to a random value and holds that value until reset is activated. The latched value of  $\overline{EA}$  must agree with the current logic level at that pin in order for the device to function properly.

## 20. Programming the Flash

The AT89C55WD is shipped with the on-chip Flash memory array ready to be programmed. The programming interface needs a high-voltage (12-volt) program enable signal and is compatible with conventional third-party Flash or EPROM programmers.

The AT89C55WD code memory array is programmed byte-by-byte.

**Programming Algorithm:** Before programming the AT89C55WD, the address, data, and control signals should be set up according to the Flash programming mode table and Figures 21-1 and 21-2. To program the AT89C55WD, take the following steps:

1. Input the desired memory location on the address lines.
2. Input the appropriate data byte on the data lines.
3. Activate the correct combination of control signals.
4. Raise  $\overline{EA}/V_{PP}$  to 12V.
5. Pulse  $ALE/\overline{PROG}$  once to program a byte in the Flash array or the lock bits. The byte-write cycle is self-timed and typically takes no more than 50  $\mu$ s. Repeat steps 1 through 5, changing the address and data for the entire array or until the end of the object file is reached.

**Chip Erase Sequence:** Before the AT89C55WD can be reprogrammed, a Chip Erase operation needs to be performed. To erase the contents of the AT89C55WD, follow this sequence:

1. Raise  $V_{CC}$  to 6.5V.
2. Pulse  $\overline{ALE}/\overline{PROG}$  once (duration of 200 - 500 ns).
3. Wait for 150 ms.
4. Power  $V_{CC}$  down and up to 6.5V.
5. Pulse  $\overline{ALE}/\overline{PROG}$  once (duration of 200 - 500 ns).
6. Wait for 150 ms.
7. Power  $V_{CC}$  down and up.

**Data Polling:** The AT89C55WD features  $\overline{Data}$  Polling to indicate the end of a write cycle. During a write cycle, an attempted read of the last byte written will result in the complement of the written data on P0.7. Once the write cycle has been completed, true data is valid on all outputs, and the next cycle may begin.  $\overline{Data}$  Polling may begin any time after a write cycle has been initiated.

**Ready/Busy:** The progress of byte programming can also be monitored by the  $RDY/\overline{BSY}$  output signal. P3.0 is pulled low after  $\overline{ALE}$  goes high during programming to indicate  $\overline{BUSY}$ . P3.0 is pulled high again when programming is done to indicate READY.

**Program Verify:** If lock bits LB1 and LB2 have not been programmed, the programmed code data can be read back via the address and data lines for verification. The status of the individual lock bits can be directly verified by reading them back.

**Reading the Signature Bytes:** The signature bytes are read by the same procedure as a normal verification of locations 000H, 100H, and 200H, except that P3.6 and P3.7 must be pulled to a logic low. The values returned are as follows:

- (000H) = 1EH indicates manufactured by Atmel
- (100H) = 55H
- (200H) = 06H indicates 89C55WD

## 21. Programming Interface

Every code byte in the Flash array can be programmed by using the appropriate combination of control signals. The write operation cycle is self-timed and once initiated, will automatically time itself to completion.

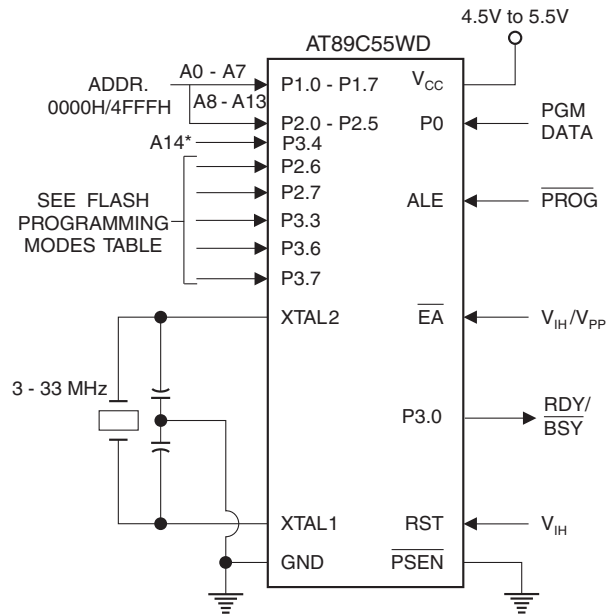

Most major worldwide programming vendors offer support for the Atmel AT89 microcontroller series. Please contact your local programming vendor for the appropriate software revision.

**Table 21-1. Flash Programming Modes**

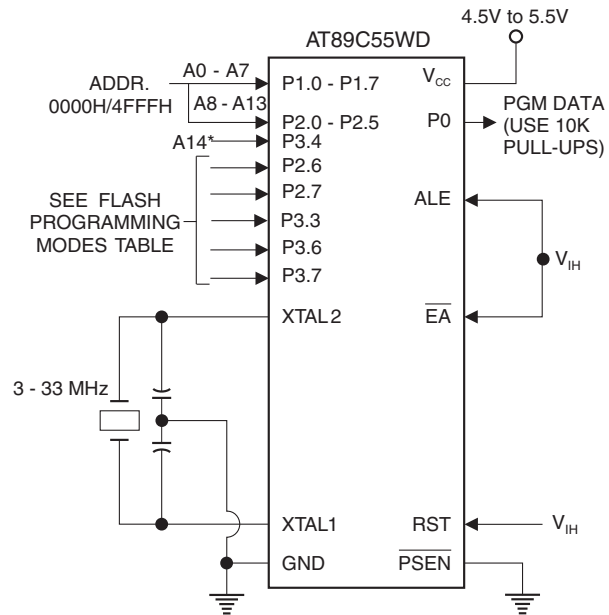

Mode	V <sub>CC</sub>	RST	PSEN	ALE/ PROG	EA/ V <sub>PP</sub>	P2.6	P2.7	P3.3	P3.6	P3.7	P0.7-0 Data	P3.4	P2.5-0	P1.7-0
												Address		
Write Code Data	5V	H	L	 <sup>(1)</sup>	12V	L	H	H	H	H	D <sub>IN</sub>	A14	A13-8	A7-0
Read Code Data	5V	H	L	H	H/12V	L	L	L	H	H	D <sub>OUT</sub>	A14	A13-8	A7-0
Write Lock Bit 1	6.5 V	H	L	 <sup>(2)</sup>	12V	H	H	H	H	H	X	X	X	X
Write Lock Bit 2	6.5 V	H	L	 <sup>(2)</sup>	12V	H	H	H	L	L	X	X	X	X
Write Lock Bit 3	6.5 V	H	L	 <sup>(2)</sup>	12V	H	L	H	H	L	X	X	X	X
Read Lock Bits 1, 2, 3	5V	H	L	H	H	H	H	L	H	L	P0.2, P0.3, P0.4	X	X	X
Chip Erase	6.5 V	H	L	 <sup>(3)</sup>	12V	H	L	H	L	L	X	X	X	X
Read Atmel ID	5V	H	L	H	H	L	L	L	L	L	1EH	X	XX 0000	00H
Read Device ID	5V	H	L	H	H	L	L	L	L	L	55H	X	XX 0001	00H
Read Device ID	5V	H	L	H	H	L	L	L	L	L	06H	X	XX 0010	00H

Notes: 1. Write Code Data requires a 200 ns PROG pulse.  
2. Write Lock Bits requires a 100 µs PROG pulse.  
3. Chip Erase requires a 200 ns - 500 ns PROG pulse.  
4. RDY/BSY signal is output on P3.0 during programming.

**Figure 21-1.** Programming the Flash Memory

**Figure 21-2.** Verifying the Flash Memory

Note: \*Programming address line A14 (P3.4) is not the same as the external memory address line A14 (P2.6).

## 22. Flash Programming and Verification Characteristics

$T_A = 20^\circ\text{C}$  to  $30^\circ\text{C}$ ,  $V_{CC} = 4.5\text{V}$  to  $5.5\text{V}$

## 24. Lock Bit Programming

## 25. Parallel Chip Erase Mode

## 26. Absolute Maximum Ratings\*

Operating Temperature.....	-55°C to +125°C
Storage Temperature .....	-65°C to +150°C
Voltage on Any Pin with Respect to Ground .....	-1.0V to +7.0V
Maximum Operating Voltage .....	6.6V
DC Output Current.....	15.0 mA

**\*NOTICE:** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## 27. DC Characteristics

The values shown in this table are valid for  $T_A = -40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  and  $V_{CC} = 4.0\text{V}$  to  $5.5\text{V}$ , unless otherwise noted.

Symbol	Parameter	Condition	Min	Max	Units
$V_{IL}$	Input Low Voltage	(Except $\overline{EA}$ )	-0.5	$0.2 V_{CC}-0.1$	V
$V_{IL1}$	Input Low Voltage ( $\overline{EA}$ )		-0.5	$0.2 V_{CC}-0.3$	V
$V_{IH}$	Input High Voltage	(Except XTAL1, RST)	$0.2 V_{CC}+0.9$	$V_{CC}+0.5$	V
$V_{IH1}$	Input High Voltage	(XTAL1, RST)	$0.7 V_{CC}$	$V_{CC}+0.5$	V
$V_{OL}$	Output Low Voltage <sup>(1)</sup> (Ports 1,2,3)	$I_{OL} = 1.6 \text{ mA}$		0.45	V
$V_{OL1}$	Output Low Voltage <sup>(1)</sup> (Port 0, ALE, $\overline{PSEN}$ )	$I_{OL} = 3.2 \text{ mA}$		0.45	V
$V_{OH}$	Output High Voltage (Ports 1,2,3, ALE, $\overline{PSEN}$ )	$I_{OH} = -60 \mu\text{A}$ , $V_{CC} = 5\text{V} \pm 10\%$	2.4		V
		$I_{OH} = -25 \mu\text{A}$	$0.75 V_{CC}$		V
		$I_{OH} = -10 \mu\text{A}$	$0.9 V_{CC}$		V
$V_{OH1}$	Output High Voltage (Port 0 in External Bus Mode)	$I_{OH} = -800 \mu\text{A}$ , $V_{CC} = 5\text{V} \pm 10\%$	2.4		V
		$I_{OH} = -300 \mu\text{A}$	$0.75 V_{CC}$		V
		$I_{OH} = -80 \mu\text{A}$	$0.9 V_{CC}$		V
$I_{IL}$	Logical 0 Input Current (Ports 1,2,3)	$V_{IN} = 0.45\text{V}$		-50	$\mu\text{A}$
$I_{TL}$	Logical 1 to 0 Transition Current (Ports 1,2,3)	$V_{IN} = 2\text{V}$ , $V_{CC} = 5\text{V} \pm 10\%$		-650	$\mu\text{A}$
$I_{LI}$	Input Leakage Current (Port 0, $\overline{EA}$ )	$0.45 < V_{IN} < V_{CC}$		$\pm 10$	$\mu\text{A}$
RRST	Reset Pulldown Resistor		10	30	$\text{k}\Omega$
$C_{IO}$	Pin Capacitance	Test Freq. = 1 MHz, $T_A = 25^{\circ}\text{C}$		10	pF
$I_{CC}$	Power Supply Current	Active Mode, 12 MHz		25	mA
		Idle Mode, 12 MHz		6.5	mA
	Power-down Mode <sup>(1)</sup>	$V_{CC} = 5.5\text{V}$		100	$\mu\text{A}$

- Notes: 1. Under steady state (non-transient) conditions,  $I_{OL}$  must be externally limited as follows:  
Maximum  $I_{OL}$  per port pin: 10 mA  
Maximum  $I_{OL}$  per 8-bit port:  
Port 0: 26 mA      Ports 1, 2, 3: 15 mA  
Maximum total  $I_{OL}$  for all output pins: 71 mA  
If  $I_{OL}$  exceeds the test condition,  $V_{OL}$  may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.
2. Minimum  $V_{CC}$  for Power-down is 2V.

## 28. AC Characteristics

Under operating conditions, load capacitance for Port 0, ALE/ $\overline{\text{PROG}}$ , and  $\overline{\text{PSEN}}$  = 100 pF; load capacitance for all other outputs = 80 pF.

### 28.1 External Program and Data Memory Characteristics
