1. Electrical Characteristics

1.1 Absolute Maximum Ratings

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Storage temperature	−65 to +175	°C
Voltage on any pin except $\overline{RESET}$ with respect to ground	−0.5 to V_{CC}+0.5	V
Voltage on $\overline{RESET}$ with respect to ground	−0.5 to +13.0	V

Notes: 1. "Max" means the highest value where the pin is guaranteed to be read as low

2. "Min" means the lowest value where the pin is guaranteed to be read as high

3. Although each I/O port can sink more than the test conditions (20mA at V_{CC} = 5V) under steady state conditions (non-transient), the following must be observed:
   1] The sum of all IOL, for all ports, should not exceed 400mA.

1.5 Memory Endurance

EEPROM endurance: 50,000 Write/Erase cycles.

Flash endurance: 10,000 Write/Erase cycles.

2. Grade 0 Qualification

The ATmega16M1/ATmega16M1/32M1/32C1/64M1/64C1/ATA8888/ATmega64M1/ATmega64C1 has been developed and manufactured according to the most stringent quality assurance requirements of ISO-TS-16949 and verified during product qualification as per AEC-Q100 grade 0.

AEC-Q100 qualification relies on temperature accelerated stress testing. High temperature field usage however may result in less significant stress test acceleration. In order to prevent the risk that ATmega16M1/ATmega16M1/32M1/32C1/64M1/64C1/ATA8888/ATmega64M1/ATmega64C1 lifetime would not satisfy the application end-of-life reliability requirements, Atmel® has extended the testing, whenever applicable (high temperature operating life test, high temperature storage life, data retention, thermal cycles), far beyond the AEC-Q100 requirements. Thereby, Atmel verified the ATmega16M1/ATmega16M1/32M1/32C1/64M1/64C1/ATA8888/ATmega64M1/ATmega64C1 has a long safe lifetime period after the grade 0 qualification acceptance limits.

The valid domain calculation depends on the activation energy of the potential failure mechanism that is considered. Therefore any temperature mission profile which could exceed the AEC-Q100 equivalence domain shall be submitted to Atmel for a thorough reliability analysis
