Nonlinearity Error, max. T _{MIN} to T _{MAX}	±0.012%		
Differential Nonlinearity Error, max. T _{MIN} to T _{MAX}	±0.024%		
Monotonicity	Guaranteed over oper. temp. range		
Gain Tempco, max.	±20ppm/°C		
Offset Tempco, Bipolar, max.	±10ppm/°C of FSR ②		
Zero Tempco, max.	±1.5ppm/°C of FSR ②		
Settling Time, ns max. ③	25	25	50
Power Supply Sensitivity	±0.01%/Supply		
OUTPUTS			
Output Current Range, Unipolar	0 to +5mA		
Output Current Range, Bipolar	±2.5mA		
Output Compliance Voltage	±1.2V		
Output Voltage Ranges ①	0 to -5V 0 to -10V ±2.5V ±5V ±10V		
Output Resistance	400 Ohms ±10%		
Output Capacitance	15pF		
Output Leakage Current, All Bits OFF	15nA		
POWER REQUIREMENTS			
Supply Voltages	±15V ±0.5V		
Positive Quiescent Current, max.	40mA	45mA	50mA
Negative Quiescent Current, max.	17mA	17mA	17mA
PHYSICAL ENVIRONMENTAL			
Operating Temperature Range, Case	0°C to +70°C (BMC) -55°C to +125°C (BMM, 883)		
Storage Temperature Range	-65°C to +150°C		
Package Type	24-pin ceramic DDIP		
Weight	0.22 ounces (6.3 grams)		

Footnotes

- ① With external operational amplifier.
 ② FSR is Full Scale Range, or the difference between minimum and maximum output values.
 ③ Full-scale current change to ±1LSB with 400Ω load.

TECHNICAL NOTES

- Proper operation of the DAC-HF Series converters is dependent on good board layout and connection practices. Bypass supplies as shown in the connection diagrams. Mount bypass capacitors close to the converter, directly to the supply pins where possible.
- Use of a ground plane is particularly important in high-speed D/A converters as it reduces high-frequency noise and aids in decoupling the digital inputs from the analog output. Avoid ground loop problems by connecting all grounds on the board to the ground plane. The remainder of the ground plane should include as much of the circuit board as possible.
- When the converter is configured for voltage output with an external operational amplifier, keep the leads from the converter to the output amplifier as short as possible.
- The high-speed current switching technique used in the DAC-HF Series inherently reduces the amplitude and duration of large transient spikes at the output ("glitches"). The most severe glitches occur at half-scale, the major carry transition from 011 ... 1 to 100 ... 0 or vice versa. At this time, a skewing of the input codes can create a transition state code of 111 ... 1. The duration of the "transition state code" is dependent on the degree of skewing, but its effect is dependent on the speed of the DAC (an ultra-fast DAC will respond to these brief spurious inputs to a greater degree than a slow DAC).

Minimize the effects of input skewing by using a high-speed input register to match input switching times. The input register recommended for use with the DAC-HF is easily implemented with two Texas Instruments SN74S174 hex D-type flip-flops. This register will reduce glitches to a very low level and ensure fast output settling times.
- Test the DAC-HF using a low-capacitance test probe (such as a 10X probe). Take care to assure the shortest possible connection between probe ground and circuit ground. Long probe ground leads may pick up environmental E.M.I. causing artifacts on the scope display, i.e., signals that do not originate at the unit under test.
- Passive components used with the DAC-HF may be as indicated here: 0.1μF and 1μF bypass capacitors should be ceramic type and tantalum type respectively; the 400Ω output load is a ±0.1%, 10ppm/°C, metal-film type; adjustment potentiometers are cermet types; other resistors may be ±10% carbon composition types.
- Output voltage compliance is ±1.2V to preserve the linearity of the converter. In the bipolar mode, the DAC-HF can be operated with no load to give an output voltage of ±1.0V. In the unipolar mode, the load resistance must be less than 600Ω to give less than +1.2V output. The specified output currents of 0 to +5mA and ±2.5mA are measured into a short circuit or an operational amplifier summing junction.

CALIBRATION PROCEDURE

Unipolar Output Current

1. Connect the converter as shown in Figure 2.
2. Set all inputs low and adjust the ZERO ADJUST potentiometer for a reading of 0V at the output.
3. Set all inputs high and adjust the GAIN ADJUST potentiometer for a reading of $-F.S. + 1LSB$ (See Table 1).

Bipolar Output Current

1. Connect the converter as shown in Figure 3.
2. Set all inputs low and adjust the OFFSET ADJUST and LOAD potentiometer for an output reading of $+F.S.$ (See Table 2).
3. Set all inputs high and adjust the GAIN ADJUST potentiometer for an output reading of $-F.S. + 1LSB$ (See Table 2).
