Product data sheet

1. General description

The ISP1102 Universal Serial Bus (USB) transceiver is fully compliant with *Universal Serial Bus Specification Rev. 2.0.* The ISP1102 can transmit and receive USB data at full-speed (12 Mbit/s).

The transceiver allows USB Application-Specific Integrated Circuits (ASICs) and Programmable Logic Devices (PLDs) with power supply voltages from 1.65 V to 3.6 V to interface with the physical layer of the USB. The transceiver has an integrated 5 V-to-3.3 V voltage regulator for direct powering through USB supply line V_{BUS} . The transceiver has an integrated voltage detector to detect the presence of the V_{BUS} voltage ($V_{CC(5V0)}$). When $V_{CC(5V0)}$ or VREG3V3 is lost, the DP and DM pins can be shared with other serial protocols.

The transceiver is a bidirectional differential interface and is available in HBCC16 and HVQFN14 packages.

The transceiver is ideal for use in portable electronic devices, such as mobile phones, digital still cameras, Personal Digital Assistants (PDAs) and Information Appliances (IAs).

2. Features

- Complies with Universal Serial Bus Specification Rev. 2.0
- Supports data transfer at full-speed (12 Mbit/s)
- Integrated 5 V-to-3.3 V voltage regulator to power through USB line V_{BUS}
- V_{BUS} voltage presence indication on pin VBUSDET
- VP and VM pins function in bidirectional mode, allowing pin count saving for the ASIC interface
- Used as USB device transceiver or USB host transceiver
- Stable RCV output during Single-Ended Zero (SE0) condition
- Two single-ended receivers with hysteresis
- Low-power operation
- Supports I/O voltage range from 1.65 V to 3.6 V
- ±12 kV ElectroStatic Discharge (ESD) protection (for the ISP1102W) at the DP, DM, V_{CC(5V0)} and GND pins
- Full industrial operating temperature range from -40 °C to +85 °C
- Available in HBCC16 and HVQFN14 lead-free and halogen-free packages

ST-NXP Wireless

Advanced USB transceiver

3. Applications

- Portable electronic devices, such as:
 - ◆ Mobile phone
 - ◆ Digital still camera
 - Personal Digital Assistant (PDA)
 - ◆ Information Appliance (IA)

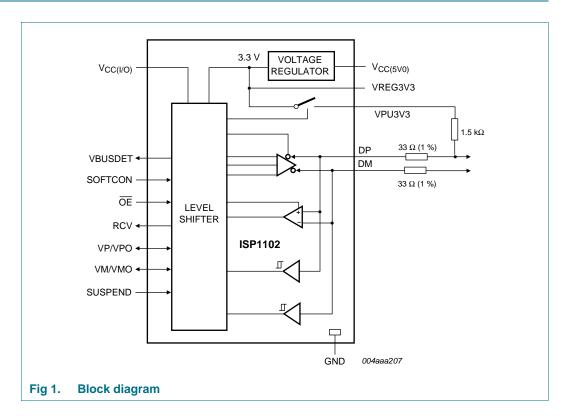

4. Ordering information

Table 1. Ordering information

Type number	Package					
	Name	Description	Version			
ISP1102W	HBCC16	plastic thermal enhanced bottom chip carrier; 16 terminals; body 3 \times 3 \times 0.65 mm	SOT639-2			
ISP1102BS	HVQFN14	plastic thermal enhanced very thin quad flat package; no leads; 14 terminals; body 2.5 \times 2.5 \times 0.85 mm	SOT773-1			

^[1] For new designs planning to use the ISP1102W, refer to the ISP1102A Advanced USB transceiver data sheet.

Pinning information

6.1 Pinning

6.2 Pin description

Table 2. Pin description

Symbol[1]	Pin		Туре	Description		
	HBCC16	HBCC16 HVQFN14				
ŌĒ	1	1	I	input for output enable (CMOS level with respect to $V_{CC(I/O)}$, active LOW); enables the transceiver to transmit data on the USB bus input pad; push pull; CMOS		
RCV	2	2	0	differential data receiver output (CMOS level with respect to $V_{CC(I/O)}$); driven LOW when input SUSPEND is HIGH; the output state of RCV is preserved and stable during an SE0 condition		
				output pad; push pull; 4 mA output drive; CMOS		
VP/VPO	3	3	I/O	single-ended DP receiver output VP (CMOS level with respect to $V_{CC(I/O)}$); for external detection of SE0, error conditions and speed of connected device; this pin also acts as drive data input VPO; see <u>Table 3</u> and <u>Table 4</u>		
				bidirectional pad; push-pull input; 3-state output; 4 mA output drive; CMOS		
VM/VMO	4	4	I/O	single-ended DM receiver output VM (CMOS level with respect to $V_{CC(I/O)}$); for external detection of SE0, error conditions and speed of connected device; this pin also acts as drive data input VMO; see <u>Table 3</u> and <u>Table 4</u> bidirectional pad; push-pull input; 3-state output; 4 mA output drive; CMOS		

Advanced USB transceiver

 Table 2.
 Pin description ...continued

Symbol[1]	Pin		Type	Description
	HBCC16	HVQFN14		
SUSPEND	5	5	I	suspend input (CMOS level with respect to $V_{\text{CC(I/O)}}$); a HIGH level enables low-power state while the USB bus is inactive and drives output RCV to a LOW level
				input pad; push pull; CMOS
n.c.	6	-	-	not connected
V _{CC(I/O)}	7	6	-	supply voltage for digital I/O pins (1.65 V to 3.6 V). When $V_{CC(I/O)}$ is not connected, the DP and DM pins are in 3-state. This supply pin is totally independent of $V_{CC(5V0)}$ and VREG3V3 and must never exceed the VREG3V3 voltage.
VBUSDET	8	7	0	V_{BUS} indicator output (CMOS level with respect to $V_{CC(I/O)}$); when $V_{BUS} > 4.1$ V, VBUSDET = HIGH and when $V_{BUS} < 3.6$ V, VBUSDET = LOW; when SUSPEND = HIGH, the VBUSDET function is invalid output pad; push pull; 4 mA output drive; CMOS
DM	9	8	AI/O	negative USB data bus connection (analog, differential)
DP	10	9	AI/O	positive USB data bus connection (analog, differential)
n.c.	11	-	-	not connected
n.c.	12	-	_	not connected
n.c.	-	10	_	not connected
VREG3V3	13	11	-	internal regulator option: regulated supply voltage output (3.0 V to 3.6 V) during 5 V operation; a decoupling capacitor of at least 0.1 μF is required
				regulator bypass option : used as a supply voltage input (3.3 V \pm 10 %) for 3.3 V operation
V _{CC(5V0)}	14	12	-	internal regulator option: supply voltage input (4.0 V to 5.5 V); can be directly connected to USB line V_{BUS}
				regulator bypass option: connect to VREG3V3
VPU3V3	15	13	-	pull-up supply voltage (3.3 V \pm 10 %); connect an external 1.5 k $\!\Omega$ resistor on DP (full-speed)
				This pin function is controlled by the SOFTCON input:
				SOFTCON = LOW — VPU3V3 floating (high-Z); ensures zero pull-up current
				SOFTCON = HIGH — VPU3V3 = 3.3 V; internally connected to VREG3V3
SOFTCON	16	14	I	software controlled USB connection input; a HIGH level applies 3.3 V to pin VPU3V3, which is connected to an external 1.5 k Ω pull-up resistor; this allows USB connect or disconnect signaling to be controlled by software
				input pad; push pull; CMOS
GND	exposed die pad	exposed die pad	-	ground supply; down bonded to the exposed die pad (heat sink); to be connected to the PCB ground

^[1] Symbol names with an overscore (for example, $\overline{\text{OE}}$) indicate active LOW signals.

Advanced USB transceiver

7. Functional description

7.1 Function selection

Table 3. Function selection

SUSPEND	OE	DP, DM	RCV	VP/VPO	VM/VMO	Function
LOW	LOW	driving or receiving	active	VPO input	VMO input	normal driving (differential receiver active)
LOW	HIGH	receiving[1]	active	VP output	VM output	receiving
HIGH	LOW	driving	inactive ^[2]	VPO input	VMO input	driving during suspend (differential receiver inactive)
HIGH	HIGH	high-Z ^[1]	inactive ^[2]	VP output	VM output	low-power state

^[1] Signal levels on the DP and DM pins are determined by other USB devices and external pull-up or pull-down resistors.

7.2 Operating functions

Table 4. Driving function using differential input data interface (pin $\overline{OE} = LOW$)

VM/VMO	VP/VPO	Data
LOW	LOW	SE0
LOW	HIGH	differential logic 1
HIGH	LOW	differential logic 0
HIGH	HIGH	illegal state

Table 5. Receiving function (pin $\overline{OE} = HIGH$)

DP, DM	RCV	VP/VPO	VM/VMO
Differential logic 0	LOW	LOW	HIGH
Differential logic 1	HIGH	HIGH	LOW
SE0	RCV*[1]	LOW	LOW

^[1] RCV* denotes the signal level on output RCV just before the SE0 state occurs. This level is stable during the SE0 period.

7.3 Power supply configurations

The ISP1102 can be used with various power supply configurations, which can be changed dynamically. <u>Table 7</u> provides an overview of power supply configurations.

Normal mode — $V_{CC(I/O)}$ is connected. $V_{CC(5V0)}$ is connected only, or $V_{CC(5V0)}$ and VREG3V3 are connected.

For the 5 V operation, $V_{CC(5V0)}$ is connected to a 5 V source (4.0 V to 5.5 V). The internal voltage regulator then produces 3.3 V for USB connections.

For the 3.3 V operation, both $V_{CC(5V0)}$ and VREG3V3 are connected to a 3.3 V source (3.0 V to 3.6 V).

 $V_{CC(I/O)}$ is independently connected to a voltage source (1.65 V to 3.6 V), depending on the supply voltage of the external circuit.

^[2] In suspend mode (SUSPEND = HIGH), the differential receiver is inactive and output RCV is always LOW. The resume signaling is detected through single-ended receivers VP/VPO and VM/VMO.

Advanced USB transceiver

Sharing mode — $V_{CC(I/O)}$ is connected only, $V_{CC(5V0)}$ is < 3.6 V and VREG3V3 is < 2.4 V. In this mode, the DP and DM pins are 3-stated and the ISP1102 allows external signals of up to 3.6 V to share the DP and DM lines. The internal circuits of the ISP1102 ensure that virtually no current (maximum 10 μ A) is drawn through the DP and DM lines. The power consumption through pin $V_{CC(I/O)}$ drops to the low-power (suspended) state level.

Pins VBUSDET and RCV are driven to LOW to indicate this mode. The VBUSDET function is ignored during suspend mode of the ISP1102.

Some hysteresis is built into the detection of VREG3V3 lost.

Table 6. Pin states in sharing mode

Pin	Sharing mode
V _{CC(5V0)}	< 3.6 V
VREG3V3	< 2.4 V
V _{CC(I/O)}	1.65 V to 3.6 V input
VPU3V3	high-Z (off)
DP, DM	high-Z
VP/VPO, VM/VMO[1]	high-Z
RCV	LOW
VBUSDET	LOW
OE, SUSPEND, SOFTCON	high-Z

^[1] VP/VPO and VM/VMO are bidirectional pins.

Table 7. Power supply configuration overview

V _{CC(5V0)}	Configuration	Special characteristics
Connected	normal mode	-
< 3.6 V	sharing mode	DP, DM and VPU3V3 high-Z; VBUSDET is driven LOW

ISP1102 ST-NXP Wireless

Advanced USB transceiver

7.4 Power supply input options

The ISP1102 has two power supply input options.

Internal regulator — Pin $V_{CC(5V0)}$ is connected to 4.0 V to 5.5 V. The internal regulator is used to supply the internal circuitry with 3.3 V (nominal). The VREG3V3 pin becomes a 3.3 V output reference.

Regulator bypass — Pins V_{CC(5V0)} and VREG3V3 are connected to the same supply. The internal regulator is bypassed and the internal circuitry is supplied directly from pin VREG3V3. The voltage range is 3.0 V to 3.6 V to comply with Universal Serial Bus Specification Rev. 2.0.

The supply voltage range for each input option is specified in Table 8.

Table 8. **Power supply input options**

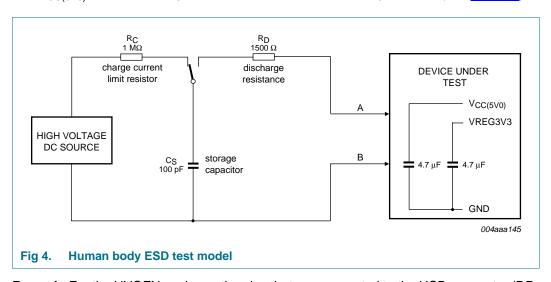

Input option	V _{CC(5V0)}	VREG3V3	V _{CC(I/O)}
Internal regulator	supply input for internal regulator (4.0 V to 5.5 V)	voltage reference output (3.3 V, 300 $\mu\text{A})$	supply input for digital I/O pins (1.65 V to 3.6 V)
Regulator bypass	connected to VREG3V3 with maximum voltage drop of 0.3 V (2.7 V to 3.6 V)	supply input (3.0 V to 3.6 V)	supply input for digital I/O pins (1.65 V to 3.6 V)

Advanced USB transceiver

8. ElectroStatic Discharge (ESD)

8.1 ESD protection

For the HBCC package, the pins that are connected to the USB connector (DP, DM, $V_{CC(5V0)}$ and GND) have a minimum of ± 12 kV ESD protection. The ± 12 kV measurement is limited by the test equipment. Capacitors of 4.7 μ F connected from VREG3V3 to GND and $V_{CC(5V0)}$ to GND are required to achieve this ± 12 kV ESD protection (see Figure 4).

Remark: For the HVQFN package, the pins that are connected to the USB connector (DP, DM, $V_{CC(5V0)}$ and GND) have a minimum of ± 7 kV ESD protection.

8.2 ESD test conditions

A detailed report on test set up and results is available on request.

15. Packing information

The ISP1102W (HBCC16 package) is delivered on a Type A carrier tape, see <u>Figure 14</u>. The tape dimensions are given in <u>Table 15</u>.

The reel diameter is 330 mm. The reel is made of polystyrene (PS) and is not designed for use in baking process.

The cumulative tolerance of 10 successive sprocket holes is ± 0.02 mm. The camber must not exceed 1 mm in 100 mm.

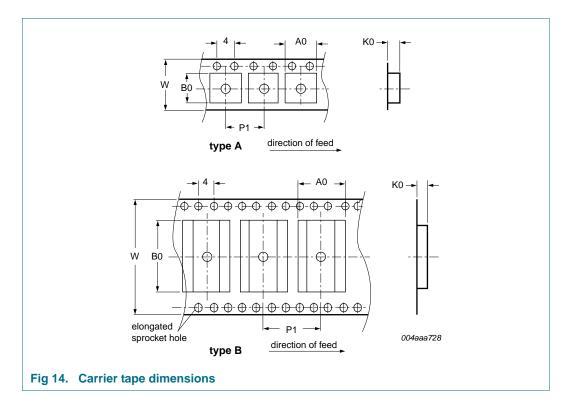

Table 15. Type A carrier tape dimensions for the ISP1102W

Dimension	Value	Unit
A0	3.3	mm
В0	3.3	mm
K0	1.1	mm
P1	8.0	mm
W	12.0 ± 0.3	mm

16. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365* "Surface mount reflow soldering description".

Advanced USB transceiver

16.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

16.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- · Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

16.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

16.4 Reflow soldering

Key characteristics in reflow soldering are:

 Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see <u>Figure 15</u>) than a SnPb process, thus reducing the process window

Advanced USB transceiver

- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with Table 16 and 17

Table 16. SnPb eutectic process (from J-STD-020C)

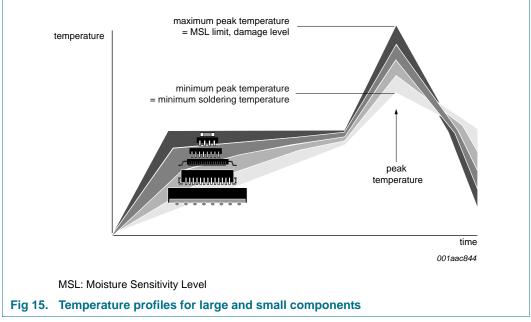

Package thickness (mm)	Package reflow temperature (°C)			
	Volume (mm³)			
	< 350	≥ 350		
< 2.5	235	220		
≥ 2.5	220	220		

Table 17. Lead-free process (from J-STD-020C)

Package thickness (mm)) Package reflow temperature (°C)				
	Volume (mm ³)				
	< 350	350 to 2000	> 2000		
< 1.6	260	260	260		
1.6 to 2.5	260	250	245		
> 2.5	250	245	245		

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see Figure 15.
