PIN FUNCTIONS

**LTC1440**

GND (Pin 1): Ground. Connect to V⁻ for single supply operation.

V⁻ (Pin 2): Negative Supply. Connect to ground for single supply operation. Potential should be more negative than GND.

IN⁺ (Pin 3): Noninverting Comparator Input. Input common mode range from V⁻ to V⁺ -1.3V. Input current typically 10pA at 25°C.

IN⁻ (Pin 4): Inverting Comparator Input. Input common mode range from V⁻ to V⁺ -1.3V. Input current typically 10pA at 25°C.

HYST (Pin 5): Hysteresis Input. Connect to REF if not used. Input voltage range is from V_{REF} to V_{REF} - 50mV.

REF (Pin 6): Reference Output. 1.182V with respect to V⁻. Can source up to 200μA and sink 15μA at 25°C. Drive 0.01μF bypass capacitor without oscillation.

V⁺ (Pin 7): Positive Supply. 2V to 11V.

OUT (Pin 8): Comparator CMOS Output. Swings from GND to V⁺. Output can source up to 40mA and sink 5mA.

LTC1441

OUT A (Pin 1): Comparator A CMOS Output. Swings from V⁻ to V⁺. Output can source up to 40mA and sink 5mA.

V⁻ (Pin 2): Negative Supply.

IN A⁺ (Pin 3): Noninverting Input of Comparator A. Input common mode range from V⁻ to V⁺ -1.3V. Input current typically 10pA at 25°C.

IN A⁻ (Pin 4): Inverting Input of Comparator A. Input common mode range from V⁻ to V⁺ -1.3V. Input current typically 10pA at 25°C.

IN B⁻ (Pin 5): Inverting Input of Comparator B. Input common mode range from V⁻ to V⁺ -1.3V. Input current typically 10pA at 25°C.

IN B⁺ (Pin 6): Noninverting Input of Comparator B. Input common mode range from V⁻ to V⁺ -1.3V. Input current typically 10pA at 25°C.

V⁺ (Pin 7): Positive Supply. 2V to 11V.

OUT B (Pin 8): Comparator B CMOS Output. Swings from V⁻ to V⁺. Output can source up to 40mA and sink 5mA.

LTC1442

OUT A (Pin 1): Comparator A CMOS Output. Swings from V⁻ to V⁺. Output can source up to 40mA and sink 5mA.

V⁻ (Pin 2): Negative Supply.

IN A⁺ (Pin 3): Noninverting Input of Comparator A. Input common mode range from V⁻ to V⁺ -1.3V. Input current typically 10pA at 25°C.

IN B⁻ (Pin 4): Inverting Input of Comparator B. Input common mode range from V⁻ to V⁺ -1.3V. Input current typically 10pA at 25°C.

HYST (Pin 5): Hysteresis Input. Connect to REF if not used. Input voltage range is from V_{REF} to V_{REF} - 50mV.

REF (Pin 6): Reference Output. 1.182V with respect to V⁻. Can source up to 200μA and sink 15μA at 25°C. Drive 0.01μF bypass capacitor without oscillation.

V⁺ (Pin 7): Positive Supply. 2V to 11V.

OUT B (Pin 8): Comparator B CMOS Output. Swings from V⁻ to V⁺. Output can source up to 40mA and sink 5mA.

APPLICATIONS INFORMATION

LTC1440/LTC1441/LTC1442 are a family of micropower comparators with built-in 1.182V reference. Features include programmable hysteresis (LTC1440/LTC1442), wide supply voltage range (2V to 11V) and the ability of the reference to drive up to a 0.01 μ F capacitor without oscillation. The comparators' CMOS outputs can source up to 40mA and the supply current glitches, that normally occur when switching logic states, have been eliminated.

Power Supplies

The comparator family operates from a single 2V to 11V supply. The LTC1440 includes a separate ground for the comparator output stage, allowing a split supply ranging from ± 1 V to ± 5.5 V. Connecting V^- to GND on the LTC1440 will allow single supply operation. If the comparator output is required to source more than 1mA, or the supply source impedance is high, V^+ should be bypassed with a 0.1 μ F capacitor.

Comparator Inputs

The comparator inputs can swing from the negative supply V^- to within 1.3V max of the positive supply V^+ . The inputs can be forced 300mV below V^- or above V^+ without damage and the typical input leakage current is only ± 10 pA.

Comparator Outputs

The LTC1440 comparator output swings between GND and V^+ to assure TTL compatibility with a split supply. The LTC1441 and LTC1442 outputs swing between V^- and V^+ . The outputs are capable of sourcing up to 40mA and sinking up to 5mA while still maintaining microampere quiescent currents. The output stage does not generate crowbar switching currents during transitions which helps minimize parasitic feedback through the supply pins.

Voltage Reference

The internal bandgap reference has a voltage of 1.182V referenced to V^- . The reference accuracy is 1.5% from -40°C to 85°C . It can source up to 200 μ A and sink up to 20 μ A with a 5V supply. The reference can drive a bypass

capacitor of up to 0.01 μ F without oscillation and by inserting a series resistor, capacitance values up to 100 μ F can be used (Figure 1).

Figure 2 shows the resistor value required for different capacitor values to achieve critical damping. Bypassing the reference can help prevent false tripping of the comparators by preventing glitches on V^+ or reference load transients from disturbing the reference output voltage.

Figure 3 shows the bypassed reference output with a square wave applied to the V^+ pin. Resistors R2 and R3 set 10mV of hysteresis voltage band while R1 damps the reference response. Note that the comparator output doesn't trip.

Figure 1. Damping the Reference Output

Figure 2. Damping Resistance vs Bypass Capacitor Value

APPLICATIONS INFORMATION

Figure 3a. Reference Transient Response Test Circuit

Figure 3b. Reference and Comparator Output Transient Response

Hysteresis

Hysteresis can be added to the LTC1440 by connecting a resistor (R1) between the REF and HYST pins and a second resistor (R2) from HYST to V⁻ (Figure 4).

The difference between the upper and lower threshold voltages, or hysteresis voltage band (V_{HB}), is equal to twice the voltage difference between the REF and HYST pins.

When more hysteresis is added, the upper threshold increases the same amount as the low threshold decreases. The maximum voltage allowed between REF and HYST pins is 50mV, producing a maximum hysteresis voltage band of 100mV. The hysteresis band could vary by

up to 15%. If hysteresis is not wanted, the HYST pin should be shorted to REF. Acceptable values for I_{REF} range from 0.1μA to 5μA. If 2.4M is chosen for R2, then the value of R1 is equal to the value of V_{HB}.

Figure 4. Programmable Hysteresis

Level Detector

The LTC1440 is ideal for use as a micropower level detector as shown in Figure 5. R1 and R2 form a voltage divider from V_{IN} to the noninverting comparator input. R3 and R4 set the hysteresis voltage, and R5 and C1 bypass the reference output. The following design procedure can be used to select the component values:

1. Choose the V_{IN} voltage trip level, in this example 4.65V.

Figure 5. Glitch-Free Level Detector with Hysteresis

APPLICATIONS INFORMATION

2. Calculate the required resistive divider ratio.

$$\text{Ratio} = V_{\text{REF}}/V_{\text{IN}}$$

$$\text{Ratio} = 1.182\text{V}/4.65\text{V} = 0.254$$

3. Choose the required hysteresis voltage band at the input V_{HBIN} , in this example 60mV. Calculate the hysteresis voltage band referred to the comparator input V_{HB} .

$$V_{\text{HB}} = (V_{\text{HBIN}})(\text{Ratio})$$

$$V_{\text{HB}} = (60\text{mV})(0.254)$$

$$V_{\text{HB}} = 15.24\text{mV}$$

4. Choose the values for R3 and R4 to set the hysteresis.

$$R4 = 2.4\text{M}$$

$$R3(\text{k}\Omega) = V_{\text{HB}} = 15\text{k}$$

5. Choose the values for R1 and R2 to set the trip point.

$$R1 = \frac{V_{\text{REF}}}{I_{\text{BIAS}}} = \frac{1.182\text{V}}{1\mu\text{A}} = 1.18\text{M}$$

$$R2 = R1 \left[\frac{V_{\text{IN}}}{V_{\text{REF}} + \frac{V_{\text{HB}}}{2}} - 1 \right]$$

$$R2 = 1.18\text{M} \left[\frac{4.65\text{V}}{1.182\text{V} + \frac{15\text{mV}}{2}} - 1 \right]$$

$$R2 = 3.40\text{M}$$

Low Voltage Operation

It is important to note that the voltage references internal to the LTC1440 and LTC1442 can exceed the common mode range of the comparators at low supply voltages. The input common mode range of the LTC1440/LTC1441/LTC1442 comparators is guaranteed to extend up to $(V^+ - 1.3\text{V})$. Therefore, if one of the comparator inputs is at the 1.182V reference voltage, the minimum supply voltage is 2.5V for a valid output reading.

The guaranteed minimum operating voltage for the LTC1440/LTC1441/LTC1442 is 2V (or $\pm 1\text{V}$). However, both the reference and comparator(s) will function with a supply voltage as low as 1.5V, but performance will degrade as the voltage goes below 2V. The voltage reference temperature coefficient will degrade slightly, and the comparators will have less output drive with an increase in propagation delay. At the reduced supply voltages, the input common mode range of the comparator(s) will still typically extend from the negative supply to approximately 1.1V below the positive supply.
