REVISION HISTORY

3/16—Rev. 0 to Rev. A

Changes to Table 4	5
--------------------------	---

12/13—Revision 0: Initial Version

SPECIFICATIONS

Performance of all channels is identical, exclusive of the interchannel gain mismatch and interchannel phase deviation specifications. Master clock = 12.288 MHz (48 kHz f_s , $256 \times f_s$ mode), input sample rate = 48 kHz, measurement bandwidth = 20 Hz to 20 kHz, word width = 24 bits, load capacitance (digital output) = 20 pF, load current (digital output) = ± 1 mA or $1.5 \text{ k}\Omega$ to $\frac{1}{2}$ DVDD supply, input voltage high = 2.0 V, input voltage low = 0.8 V, analog audio output resistive load = $3100 \text{ }\Omega$ per pin, unless otherwise noted.

ANALOG PERFORMANCE SPECIFICATIONS

Specifications guaranteed at AVDDx = 5 V, DVDD = 2.5 V, and an ambient temperature¹ (T_A) at 25°C, unless otherwise noted.

Table 1.

Parameter	Test Conditions/Comments	Min	Typ	Max	Unit
DIGITAL-TO-ANALOG CONVERTERS					
Dynamic Range	20 Hz to 20 kHz, –60 dB input	105	115.5		dB
No Filter (RMS)					
With A-Weighted Filter (RMS)		108	118		dB
Total Harmonic Distortion + Noise (THD + N)	Two channels running, –1 dBFS		–98	–85	dB
	All channels running, –1 dBFS		–98	–85	dB
Full-Scale Differential Output Voltage			3.00 (8.48)		V rms (V p-p)
Gain Error		–10		+10	%
Offset Error		–25	–6	+25	mV
Gain Drift		–30		+30	ppm/°C
Interchannel Isolation			100		dB
Interchannel Phase Deviation			0		Degrees
Volume Control					
Step			0.375		dB

ABSOLUTE MAXIMUM RATINGS

Table 8.

Parameter	Rating
Analog (AVDDx)	–0.3 V to +5.5 V
Input/Output (IOVDD)	–0.3 V to +5.5 V
Digital (DVDD)	–0.3 V to +3.6 V
PLL (PLLVDD)	–0.3 V to +3.6 V
VSUPPLY	–0.3 V to +6.0 V
Input Current (Except Supply Pins)	±20 mA
Analog Input Voltage (Signal Pins)	–0.3 V to AVDDx + 0.3 V
Digital Input Voltage (Signal Pins)	–0.3 V to DVDD + 0.3 V
Operating Temperature Range (Case)	–40°C to +125°C
Storage Temperature Range	–65°C to +150°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JA} represents junction-to-ambient thermal resistance, and θ_{JC} represents the junction-to-case thermal resistance. All characteristics are for a 4-layer board with a solid ground plane.

Table 9. Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit
80-Lead LQFP	42.3	10.0	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES

1. NC = NO CONNECT. LEAVE THIS PIN FLOATING; DO NOT TIE TO GROUND OR POWER.
2. SEE THE STANDALONE MODE SECTION (TABLE 13 AND TABLE 14) FOR THE SA_MODE SETTINGS FOR PIN 31, PIN 32, AND PIN 42 THROUGH PIN 45.

11862-003

Figure 3. Pin Configuration

Table 10. Pin Function Descriptions

Pin No.	Mnemonic ^{1, 2}	Type ³	Description
1	DAC_BIAS3	I	DAC Bias 3. AC couple Pin 1 with a 470 nF capacitor to AGND3.
2	DAC_BIAS4	I	DAC Bias 4. AC couple Pin 2 with a 470 nF capacitor to AVDD3.
3	AVDD3	PWR	Analog Power.
4 to 11	NC		No Connect. Leave these pins floating; do not tie to ground or power.
12	AVDD4	PWR	Analog Power.
13	AGND4	GND	Analog Ground.
14	PLLGND	GND	PLL Ground.
15	LF	O	PLL Loop Filter. Reference the LF pin to PLLVDD.
16	PLLVDD	PWR	PLL Power. Apply 2.5 V to power the PLL.
17	MCLKI/XTALI	I	Master Clock Input/Input to Crystal Inverter. This is a multifunction pin.
18	XTALO	O	Output from Crystal (XTAL) Inverter.
19	MCLKO	O	Master Clock Output.
20, 29, 41	DVDD	PWR	Digital Power, 2.5 V.
21, 26, 30, 40	DGND	GND	Digital Ground.
22, 39	IOVDD	PWR	Power for Digital Input and Output Pins, 3.3 V or 5 V.
23	VSENSE	I	2.5 V Regulator Output, Pass Transistor Collector. Bypass VSENSE with a 10 μ F capacitor in parallel with a 100 nF capacitor.
24	VDRIVE	O	Pass Transistor Base Driver.

Pin No.	Mnemonic ^{1, 2}	Type ³	Description
25	VSUPPLY	I	5 V Voltage Regulator Input, Pass Transistor Emitter. Bypass VSUPPLY with a 10 μ F capacitor in parallel with a 100 nF capacitor.
27	DBCLK	I/O	Bit Clock for DACs.
28	DLRCLK	I/O	Left Right Frame Clock for DACs.
31, 32	SA	I	Standalone Mode, Time Domain Multiplexed (SA_MODE TDM) State. See the Standalone Mode section, Table 13, and Table 14 for more information.
33	DSDATA6	I	DAC11 and DAC12 Serial Data Input.
34	DSDATA5	I	DAC9 and DAC10 Serial Data Input.
35	DSDATA4	I	DAC7 and DAC8 Serial Data Input.
36	DSDATA3	I	DAC5 and DAC6 Serial Data Input.
37	DSDATA2	I	DAC3 and DAC4 Serial Data Input.
38	DSDATA1	I	DAC1 and DAC2 Serial Data Input.
42	MOSI/ADDR1/SA	I	Master Output Slave Input (SPI)/Address 1 (I ² C)/Standalone Mode (SA_MODE) State. This is a multifunction pin. See the Standalone Mode section and Table 13 for more information.
43	MISO/SDA/SA	I/O	Master Output Slave Input (SPI)/Control Data Input (I ² C)/Standalone Mode (SA_MODE) State. This is a multifunction pin. See the Standalone Mode section and Table 13 for more information.
44	SCLK/SCL/SA	I	Serial Clock Input (SPI)/Control Clock Input (I ² C)/Standalone Mode (SA_MODE) State. This is a multifunction pin. See the Standalone Mode section and Table 13 for more information.
45	\overline{SS} /ADDR0/SA	I	Slave Select (SPI) Active Low/Address 0 (I ² C)/Standalone Mode (SA_MODE) State. This is a multifunction pin. See the Standalone Mode section and Table 13 for more information.
46	SA_MODE	I	Standalone Mode, Active High. This pin allows mode control of the ADAU1962 using Pin 42 to Pin 45, Pin 31, and Pin 32 (see Table 13 and Table 14 for more information).
47	PU/ \overline{RST}	I	Power-Up/Reset (Active Low). See Power-Up and Reset section for more information.
48	AGND1	GND	Analog Ground.
49	AVDD1	PWR	Analog Power.
50	DAC1P	O	DAC1 Positive Output.
51	DAC1N	O	DAC1 Negative Output.
52	DAC2P	O	DAC2 Positive Output.
53	DAC2N	O	DAC2 Negative Output.
54	DAC3P	O	DAC3 Positive Output.
55	DAC3N	O	DAC3 Negative Output.
56	DAC4P	O	DAC4 Positive Output.
57	DAC4N	O	DAC4 Negative Output.
58	AVDD2	PWR	Analog Power.
59	DAC_BIAS1	I	Filter for DAC Bias 1. AC couple Pin 59 with a 470 nF capacitor to AVDD2.
60	DAC_BIAS2	I	Filter for DAC Bias 2. AC couple Pin 60 with a 470 nF capacitor to AGND2.
61	AGND2	GND	Analog Ground.
62	CM	O	Common-Mode Reference Filter Capacitor Connection. Bypass the CM pin with a 10 μ F capacitor in parallel with a 100 nF capacitor to AGND2. The internal reference can be shut off in the PLL_CLK_CTRL1 register and the pin can be driven with an outside voltage source.
63	TS_REF	O	Voltage Reference Filter Capacitor Connection. Bypass Pin 63 with a 10 μ F capacitor in parallel with a 100 nF capacitor to AGND2.
64	DAC5P	O	DAC5 Positive Output.
65	DAC5N	O	DAC5 Negative Output.
66	DAC6P	O	DAC6 Positive Output.
67	DAC6N	O	DAC6 Negative Output.
68	DAC7P	O	DAC7 Positive Output.
69	DAC7N	O	DAC7 Negative Output.
70	DAC8P	O	DAC8 Positive Output.
71	DAC8N	O	DAC8 Negative Output.
72	DAC9P	O	DAC9 Positive Output.
73	DAC9N	O	DAC9 Negative Output.

Pin No.	Mnemonic ^{1, 2}	Type ³	Description
74	DAC10P	O	DAC10 Positive Output.
75	DAC10N	O	DAC10 Negative Output.
76	DAC11P	O	DAC11 Positive Output.
77	DAC11N	O	DAC11 Negative Output.
78	DAC12P	O	DAC12 Positive Output.
79	DAC12N	O	DAC12 Negative Output.
80	AGND3	GND	Analog Ground.

¹ AVDD1, AVDD2, AVDD3, and AVDD4 are referred to elsewhere in this data sheet as AVDDx when AVDDx means any or all of the AVDD pins.

² DAC Channel 1 to DAC Channel 12 pins are referred to elsewhere in this data sheet as DACx, DACxP, or DACxN when it means any or all of the DAC channel pins.

³ I = input, O = output, I/O = input/output, PWR = power, and GND = ground.

THEORY OF OPERATION

DIGITAL-TO-ANALOG CONVERTERS (DACs)

For improved noise and distortion performance, the ADAU1962 includes 12 differential DAC channels configured as voltage outputs for a simplified connection. The DACs include on-chip digital interpolation filters with 68 dB stop-band attenuation and linear phase response, operating at an oversampling ratio of $256\times$ (48 kHz range), $128\times$ (96 kHz range), or $64\times$ (192 kHz range). Each channel has its own independently programmable attenuator, adjustable in 255 steps in increments of 0.375 dB. Digital inputs are supplied through six serial data input pins (two channels on each pin), a common frame clock (DLRCLK), and a bit clock (DBCLK). Alternatively, any one of the time domain multiplexed (TDM) modes can be used to access up to 12 channels on a single TDM data line.

The ADAU1962 has a low propagation delay mode; this mode is an option for an f_s of 192 kHz and is enabled in Register DAC_CTRL0[2:1]. By setting these bits to 0b11, the propagation delay is reduced by the amount listed in Table 6. The shorter delay is achieved by reducing the amount of digital filtering; the negative impact of selecting this mode is reduced audio frequency response and increased out-of-band energy.

When AVDDx is supplied with +5 V, each analog output pin has a nominal common-mode (CM) dc level of +2.25 V and swings ± 2.12 V above and below the +2.25 V for a 1.5 V rms signal on each pin. Differentially, the signal is 3 V rms (8.48 V p-p) from a 0 dBFS digital input signal.

The differential analog outputs require a mere single-order, passive differential resistor-capacitor (RC) filter to provide the specified DNR performance (see Figure 9 for an example filter). The outputs can easily drive differential inputs on a separate printed circuit board (PCB) through cabling, as well as differential inputs on the same PCB.

If more signal level is required or if a more robust filter is needed, a single op amp gain stage, designed as a second-order, low-pass Bessel filter, can be used to remove the high frequency out-of-band noise present on each pin of the differential outputs. The choice of components and design of this circuit are critical to obtaining the full DNR yield of the DACs (see the recommended passive and active circuits in Figure 9 and Figure 11). This filter can be built into an active differential amplifier to provide a single-ended output with gain, if necessary. Note that the use of op amps with low slew rate or low bandwidth can cause high frequency noise and tones to fold down into the audio band; exercise care when selecting these components.

The ADAU1962 offers control over the analog performance of the DACs; it is possible to program the registers to reduce the power consumption with the trade-off of lower signal-to-noise ratio (SNR) and THD + N. The reduced power consumption is the result of changing the internal bias current to the analog output amplifiers.

The DAC_POWER1 to DAC_POWER3 registers present four basic settings for the DAC power vs. performance in each of the 12 channels: best performance, good performance, low power, and lowest power.

Alternatively, in Register PLL_CLK_CTRL1[7:6], the LOPWR_MODE bits offer global control over the power and performance for all 12 channels. The default setting is 0b00. This setting allows the channels to be controlled individually using the DAC_POWERx registers. Setting 0b10 and 0b11 selects the low power and lowest power settings, respectively. The data presented in Table 11 shows the result of setting all 12 channels to each of the four settings. The SNR and THD + N specifications are shown in relation to the measured performance of a device at the best performance setting.

The voltage at CM, the common-mode reference pin, can be used to bias the external op amps that buffer the output signals (see the Power Supply and Voltage Reference section).

Table 11. DAC Power vs. Performance

Register Setting	Best Performance	Good Performance	Low Power	Lowest Power
Total AVDDx Current	64 mA	57 mA	50 mA	43 mA
SNR	Reference	-0.2 dB	-1.5 dB	-14.2 dB
THD + N (-1 dBFS Signal)	Reference	-1.8 dB	-3.0 dB	-5.8 dB

CLOCK SIGNALS

Powering the ADAU1962 and asserting the PU/ $\overline{\text{RST}}$ pin high starts the device in either standalone mode (SA_MODE) or program mode, depending on the state of SA_MODE (Pin 46). The clock functionality of SA_MODE is described in the Standalone Mode section.

The ADAU1962 default in program mode is for the MCLKO pin to feed a buffered output of the MCLKI signal on the MCLKI/XTALI pin. The default for the DLRCLK and DBCLK ports is slave mode; to function, drive the DAC with a coherent set of master clock, frame clock, and bit clock signals.

Use Register PLL_CLK_CTRL1[5:4] to program the MCLKO pin to provide different clock signals. The default, 0b10, provides a buffered copy of the clock signal that is driving the MCLKI pin function. Two modes, 0b00 and 0b01, provide low jitter clock signals.

The 0b00 setting yields a clock rate between 4 MHz and 6 MHz, and the 0b01 setting yields a clock rate between 8 MHz and 12 MHz. Both of these clock frequencies scale automatically as ratios of the master clock inside the ADAU1962.

As an example, an input to MCLKI of 8.192 MHz and a setting of 0b00 yield an MCLKO of $(8.192/2) = 4.096$ MHz. Alternatively, an input to MCLKI of 36.864 MHz and a setting of 0b01 yield an MCLKO frequency of $(36.864/3) = 12.288$ MHz. The setting, 0b11, shuts off the MCLKO pin.

Program the PLL_CLK_CTRLx registers (Register 0x00 and Register 0x01) only after asserting the PU/ $\overline{\text{RST}}$ pin high. Select the on-chip PLL to use the clock appearing at the MCLKI/XTALI pin at a frequency of 256, 384, 512, or 768 times the sample rate (f_s), referenced to the 48 kHz mode from the master clock select (MCS) setting, as listed in Table 12.

In 96 kHz mode, the master clock frequency stays at the same absolute frequency; therefore, the actual multiplication rate is divided by 2; likewise, in 192 kHz mode, the actual multiplication rate is divided by 4.

For example, programming the ADAU1962 in $256 \times f_s$ mode derives a master clock input frequency of $256 \times 48 \text{ kHz} =$

12.288 MHz. Switching the ADAU1962 to 96 kHz operation (by writing to DAC_CTRL0[2:1]), the frequency of the master clock remains at 12.288 MHz, which is an MCS ratio of $128 \times f_s$ in this example. Therefore, in 192 kHz mode, MCS becomes $64 \times f_s$.

The internal clock for the digital core varies by mode: $512 \times f_s$ (48 kHz mode), $256 \times f_s$ (96 kHz mode), or $128 \times f_s$ (192 kHz mode). By default, the on-board PLL generates this internal master clock from an external clock.

The PLL must be powered and stable before using the ADAU1962 as a source for quality audio. A reset enables the PLL and does not require writing to the I²C or SPI port for normal operation.

With the PLL enabled, the performance of the ADAU1962 is unaffected by jitter as high as a 300 ps rms time interval error (TIE). When the internal PLL is disabled, use an independent crystal oscillator to generate the master clock.

When using the ADAU1962 in direct master clock mode, power down the PLL in the PDN_THRMSNS_CTRL_1 register. For direct master clock mode, feed a frequency of $512 \times f_s$ (referenced to 48 kHz mode) into the MCLKI pin, and set the CLK_SEL bit in the PLL_CLK_CTRL1 register to 1.

The ADAU1962 PLL can also be programmed to run from an external LRCLK without an external master clock. Setting the PLLIN bits in the PLL_CLK_CTRL0 register to 0b01 and connecting the appropriate loop filter to the LF pin (see Figure 8), the ADAU1962 PLL generates all of the necessary internal clocks for operation with no external master clock. This mode reduces the number of high frequency signals in the design, reducing EMI emissions.

It is possible to reduce the EMI emissions of the circuit further by using the internal bit clock generation setting of the BCLK_GEN bit in the DAC_CTRL1 register. Setting the BCLK_GEN bit to 1 (internal) and the SAI_MS bit to 0 (slave), the ADAU1962 generates its own bit clock; this configuration works with the PLL input register, PLL_CLK_CTRL0[7:6] set to either MCLKI/XTALI or DLRCLK. The clock on the DLRCLK pin is the only required clock in DLRCLK PLL mode.

Table 12. MCS and f_s Modes

Sample Rate Select, DAC_CTRL0[2:1]		Master Clock Select (MCS), PLL_CLK_CTRL0[2:1]							
		Setting 0, 0b00		Setting 1, 0b01		Setting 2, 0b10		Setting 3, 0b11	
f_s (kHz)	Bit Setting	Ratio	Master Clock (MHz)	Ratio	Master Clock (MHz)	Ratio	Master Clock (MHz)	Ratio	Master Clock (MHz)
32	0b00	$256 \times f_s$	8.192	$384 \times f_s$	12.288	$512 \times f_s$	16.384	$768 \times f_s$	24.576
44.1	0b00	$256 \times f_s$	11.2896	$384 \times f_s$	16.9344	$512 \times f_s$	22.5792	$768 \times f_s$	33.8688
48	0b00	$256 \times f_s$	12.288	$384 \times f_s$	18.432	$512 \times f_s$	24.576	$768 \times f_s$	36.864
64	0b01	$128 \times f_s$	8.192	$192 \times f_s$	12.288	$256 \times f_s$	16.384	$384 \times f_s$	24.576
88.2	0b01	$128 \times f_s$	11.2896	$192 \times f_s$	16.9344	$256 \times f_s$	22.5792	$384 \times f_s$	33.8688
96	0b01	$128 \times f_s$	12.288	$192 \times f_s$	18.432	$256 \times f_s$	24.576	$384 \times f_s$	36.864
128	0b10 or 0b11	$64 \times f_s$	8.192	$96 \times f_s$	12.288	$128 \times f_s$	16.384	$192 \times f_s$	24.576
176.4	0b10 or 0b11	$64 \times f_s$	11.2896	$96 \times f_s$	16.9344	$128 \times f_s$	22.5792	$192 \times f_s$	33.8688
192	0b10 or 0b11	$64 \times f_s$	12.288	$96 \times f_s$	18.432	$128 \times f_s$	24.576	$192 \times f_s$	36.864

POWER-UP AND RESET

The power sequencing of the ADAU1962 begins with AVDDx and IOVDD, followed by DVDD. It is very important that AVDDx be settled at a regulated voltage and that IOVDD be within 10% of the regulated voltage before applying DVDD. When using the ADAU1962 internal regulator, this timing occurs by default.

To guarantee proper startup, pull the PU/RST pin low by using an external resistor and then, after the power supplies have stabilized, drive PU/RST high. The PU/RST can also be pulled high using a simple RC network.

Driving the PU/RST pin low puts the device into a very low power state ($<3 \mu\text{A}$), disabling all functionality of the ADAU1962 until the PU/RST pin is asserted high. After asserting this pin high, the ADAU1962 requires 300 ms to stabilize. Toggle the MMUTE bit in the DAC_CTRL0 register for operation.

Use the PUP bit (master power-up control) in the PLL_CLK_CTRL0 register to power down the ADAU1962. Setting the master power-up bit to 0 puts the ADAU1962 in an idle state while maintaining the settings of all registers. Additionally, to power down individual sections of the ADAU1962, use the power-down bits in the PDN_THRMSSENS_CTRL1 register (TS_PDN, PLL_PDN and VREG_PDN).

The SOFT_RST bit in the PLL_CLK_CTRL0 register sets all of the control registers to their default settings while maintaining the internal clocks in default mode. The SOFT_RST bit does not power down the analog outputs, and toggling this bit does not cause audible popping sounds at the differential analog outputs.

For proper startup of the ADAU1962, follow these steps:

1. Apply power to the ADAU1962 as described previously in the Power-Up and Reset section.
2. Assert the PU/RST pin high after the power supplies are stable.
3. Set the PUP bit to 1.
4. Program all necessary registers for the desired settings.
5. Set the MMUTE bit to 0 to unmute all channels.

STANDALONE MODE

The ADAU1962 can operate without a typical I²C or SPI connection to a microcontroller. This standalone mode is available by setting the SA_MODE (Pin 46) to IOVDD. All registers are set to default except for the options shown in Table 13.

Table 13. SA_MODE Settings

Pin No.	Setting	Function
42	0	Master mode serial audio interface (SAI)
	1	Slave mode SAI
43	0	MCLKI = $256 \times f_s$, PLL on
	1	MCLKI = $384 \times f_s$, PLL on
44	0	Must be set to 0
45	0	I ² S SAI format
	1	TDM modes, determined by Pin 31 and Pin 32

Setting both the SA_MODE pin and Pin 45 to high selects TDM mode. Table 14 shows the available TDM modes; set these modes by connecting Pin 31 (SA) and Pin 32 (SA) to GND or IOVDD.

Table 14. TDM Modes

Pin No.	Setting	Function
31, 32	00	TDM4: DLRCLK pulse
	01	TDM8: DLRCLK pulse
	10	TDM16: DLRCLK pulse
	11	TDM8: DLRCLK 50% duty cycle

By powering up the ADAU1962 in SA_MODE and asserting the PU/RST high, the MCLKO pin provides a buffered version of the MCLKI/XTALI pin, whether the source is a crystal or an active oscillator.

I²C CONTROL PORT

The ADAU1962 has an I²C-compatible control port that permits programming and readback of the internal control registers for the DACs and clock system. The I²C interface of the ADAU1962 is a 2-wire interface consisting of a clock line (SCL) and a data line (SDA). SDA is bidirectional, and the ADAU1962 drives SDA either to acknowledge the master (ACK) or to send data during a read operation. The SDA line (on the MISO/SDA/SA pin) for the I²C port is an open-drain collector and requires a 2 k Ω pull-up resistor. A write or read access occurs when the SDA line is pulled low while the SCL line (on the SCLK/SCL/SA pin) is high, indicated by a start in Figure 12 and Figure 13.

SDA is only allowed to change when SCL is low, except when a start or stop condition occurs, as shown in Figure 12 and Figure 13. The first eight bits of the data-word consist of the device address and the R/W bit. The device address consists of an internal built-in address (0x04) and two address pins, the ADDR1 function of the MOSI/ADDR1/SA pin and the ADDR0 function of the SS/ADDR0/SA pin (see Table 15).

Table 15. I²C Addresses

ADDR1 (AD1)	ADDR0 (AD0)	Slave Address
0	0	0x04
0	1	0x24
1	0	0x44
1	1	0x64

I²C Write

The two address bits allow four ADAU1962 devices to be used in a system. Initiating a write operation to the ADAU1962 involves the following steps (see Figure 12):

1.

Send a start condition
2.

Send the device address with the $\overline{R/\overline{W}}$ bit set low. The ADAU1962 responds by issuing an acknowledge to indicate that it has been addressed.
3.

Send a second frame directing the ADAU1962 to which register is required to be written.

a.

A second acknowledge is issued by the ADAU1962.
4.

Send a third frame with the eight data bits required to be written to the register. A third acknowledge is issued by the ADAU1962.
5.

Send a stop condition to complete the data transfer.

Table 16. I²C Abbreviations

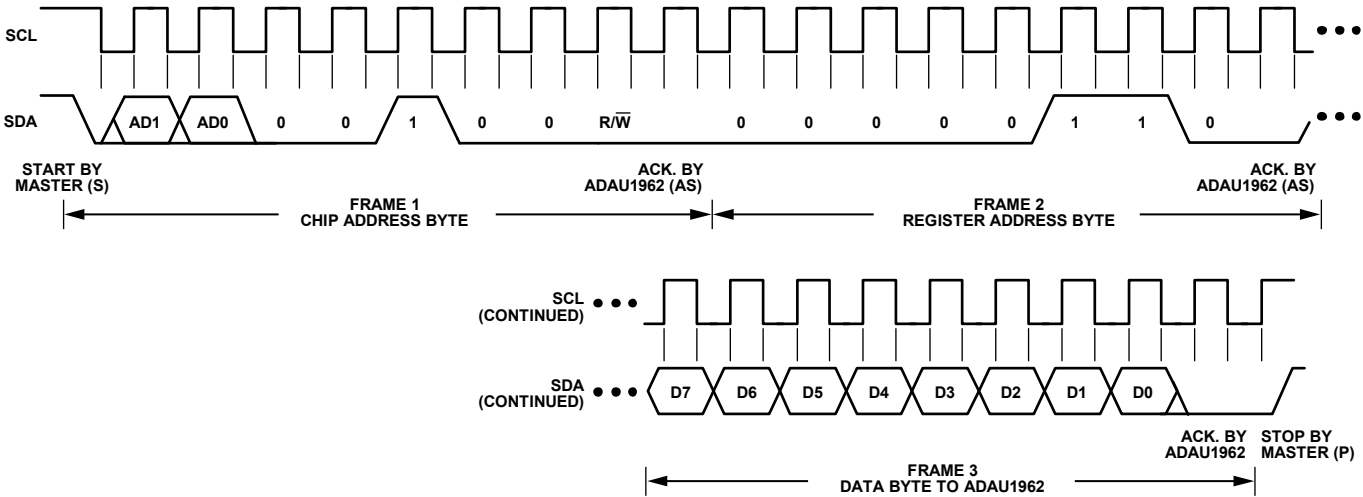

Abbreviation	Description
S	Start bit
P	Stop bit
AM	Acknowledge by master
AS	Acknowledge by slave

Table 17. Single Word I²C Write

---	---	----	------------------	----	-------------	----	-------------	----	-------------	----	---

I²C Read

A read operation requires that the user first write to the ADAU1962 to point to the correct register and then read the data. The following steps achieve this (see Figure 13):

- 1. Send a start condition followed by the device address frame with the R/W bit low and then the register address frame. The ADAU1962 responds with an acknowledge.

- 2. Issue a repeated start condition. The next frame is the device address with the R/W bit set high. On the next frame, the ADAU1962 outputs the register data on the SDA line.
- 3. Issue a stop condition to complete the read operation.

Table 19. Single Word I²C Read

S	Chip Address, R/W = 0	AS	Register Address	AS	S	Chip Address, R/W = 1	AS	Data-Word	AM	P
---	-----------------------	----	------------------	----	---	-----------------------	----	-----------	----	---

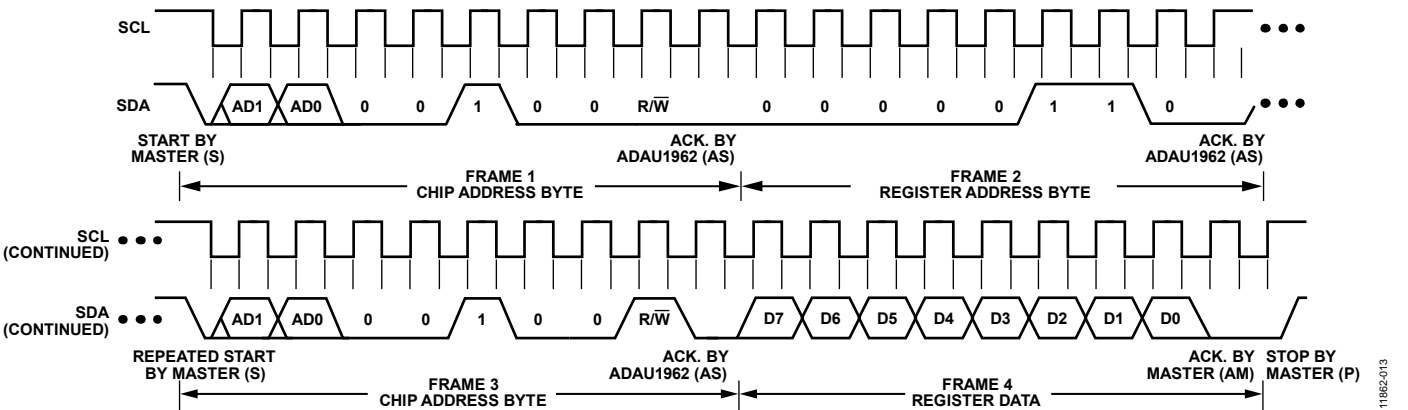

Figure 13. I²C Read Format

11962-013

SERIAL CONTROL PORT: SPI MODE

The ADAU1962 has a 4-wire SPI control port that permits the programming and reading back of the internal control registers for the DACs and clock system. A standalone mode is also available for operation without serial control; it is configured at reset using the SA_MODE pin. See the Standalone Mode section for details about the SA_MODE pin.

By default, the ADAU1962 is in I²C mode; however, to enter SPI control mode pull \overline{SS} low three times. To enter SPI control mode, perform three dummy writes to the SPI port (the ADAU1962 does not acknowledge these three writes). Beginning with the fourth SPI write, data can be written to or read from the integrated circuits. The ADAU1962 can exit SPI control mode only by a full reset initiated by power cycling the device.

The SPI control port of the ADAU1962 is a 4-wire serial control port. The format is a 24-bit wide data-word. The serial bit clock and latch can be completely asynchronous to the sample rate of the DACs. Table 21 shows the format of the SPI address byte.

The first byte is the global address with a read/write bit. For the ADAU1962, the address is 0x06, shifted left one bit due to the R/W bit. The second byte is the ADAU1962 register address, and the third byte is the data, as shown in Figure 15 and Figure 16.

Table 21. SPI Address and R/W Byte Format

Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7
0	0	0	0	1	1	0	R/W

When reading data from the ADAU1962, the MISO pin is tristated until the third byte, at which point it drives the data out (see Figure 16). The MISO pin is tristated at all other times, allowing the pin to be bussed with other devices; see Figure 17 for the timing requirements.

Chip Address R/W

The LSB of the first byte of a SPI transaction is an R/W bit. This bit determines whether the communication is a read (Logic Level 1) or a write (Logic Level 0); see Table 21 for this format.

Figure 14. SPI Mode Initial Sequence

Figure 15. SPI Write to ADAU1962 Clcking

Figure 16. SPI Read from ADAU1962 Clcking

Figure 17. Format of the SPI Signal

SPI Burst Read/Write

The SPI port is capable of performing burst reads or writes. This is accomplished by sending the chip address byte with the $\overline{R/\overline{W}}$ bit followed by the first register address that needs to be read or written to. Then, as long as \overline{SS} (on the $\overline{SS}/\text{ADDR0}/\text{SA}$ pin) is held low, registers can be sequentially read or written by continuing to send out clock pulses into SCLK (on the SCLK/SCL/SA pin). To initialize the ADAU1962

1. Send the address byte with the $\overline{R/\overline{W}}$ bit low (write).
2. Send the address of the first register.
3. Send all the register byte values.
4. Toggle the \overline{SS} pin to end the transfer.
5. Perform a burst read to verify the register writes were successful.

When referencing back to Analog Devices legacy devices, different pin names (mnemonics) were used for these SPI port functions. See Table 22 for details of the changes.

Table 22. SPI Port Pin Naming Conventions

Pin No.	Legacy Pin Mnemonic	New Pin Mnemonic
42	CDATA	MOSI
43	COUT	MISO
44	CCLK	SCLK
45	$\overline{\text{CLATCH}}$	\overline{SS}

POWER SUPPLY AND VOLTAGE REFERENCE

The ADAU1962 is designed for 5 V analog and 2.5 V digital supplies. To minimize noise pickup, bypass the power supply pins with 100 nF ceramic chip capacitors placed as close to the pins as possible. Provide a bulk aluminum electrolytic capacitor of at least 22 μF for each rail on the same PCB as the codec. It is important that the analog supply be as clean as possible.

The ADAU1962 includes a 2.5 V regulator driver that requires only an external pass transistor and bypass capacitors to make a 2.5 V regulator from a 5 V supply. Decouple the VSUPPLY and VSENSE pins with no more than 10 μF of capacitance in parallel with 100 nF high frequency bypassing. If the regulator driver is not used, connect VSUPPLY and VDRIVE to DGND, and leave VSENSE unconnected.

All digital inputs are compatible with TTL and CMOS levels. All outputs are driven from the 3.3 V or 5 V IOVDD supply and are compatible with TTL and 3.3 V CMOS levels.

The temperature sensor internal voltage reference ($V_{\text{TS_REF}}$) is made available on the TS_REF pin to filter the reference with external capacitors; bypass this pin as close to the chip as possible with a parallel combination of 10 μF and 100 nF capacitors.

The internal band gap reference that drives the common-mode reference voltage for the DACs and appears on the CM pin can be disabled in the PLL_CLK_CTRL1 register by setting VREF_EN to 0. Then, the CM pin can be driven from an external source. Use this configuration to scale all of the DACx outputs to the clipping level of a power amplifier based on its power supply voltage.

The CM pin is the internal common-mode reference. Bypass CM as close to the chip as possible with a parallel combination of 10 μF and 100 nF capacitors. Use this voltage to bias external op amps to the common-mode voltage of the analog input and output signal pins. To provide a quiet, low impedance source for the external circuitry, isolate the CM pin from the external circuitry using a high quality buffer. Use of a quiet op amp is critical because any noise added to the reference voltage is injected into the signal path.

SERIAL DATA PORTS—DATA FORMAT

The 12 DAC channels use a common serial bit clock (DBCLK) and a common left right framing clock (DLRCLK) in the serial data port. The clock signals are all synchronous with the sample rate. The normal stereo serial modes are shown in Figure 18.

The DACx serial data mode defaults to I²S (1-bit clock delay) upon power-up and reset. The ports can also be programmed for left justified and right justified (24-bit and 16-bit) operation using DAC_CTRL0[7:6]. Select stereo and TDM modes using DAC_CTRL0[5:3]. The polarity of the DLRCLK pin is programmable according to the DAC_CTRL1[5] bit, allowing for easy channel swapping.

The DBCLK pin can latch on the rising or the falling edge of the clock signal. The DAC_CTRL1[1] bit selects the active edge.

The serial ports are programmable, becoming either clock masters or slaves depending on the setting of the DAC_CTRL1[0] bit. By default, the serial ports are in slave mode.

TIME DIVISION MULTIPLEXED (TDM) MODES

The ADAU1962 serial ports also have several different TDM serial data modes. The ADAU1962 can support a single data line (TDM16), a dual data line (TDM8), a quad data line (TDM4), or eight data lines (TDM2). The DLRCLK/frame clock can operate in both single cycle pulse mode and a 50% duty cycle mode. Both 16-bit clocks or 32-bit clocks per channel are selectable for each mode.

The input/output pins of the serial ports are defined according to the serial mode that is selected. For a detailed description of the function of each pin in TDM and stereo modes, see Table 23.

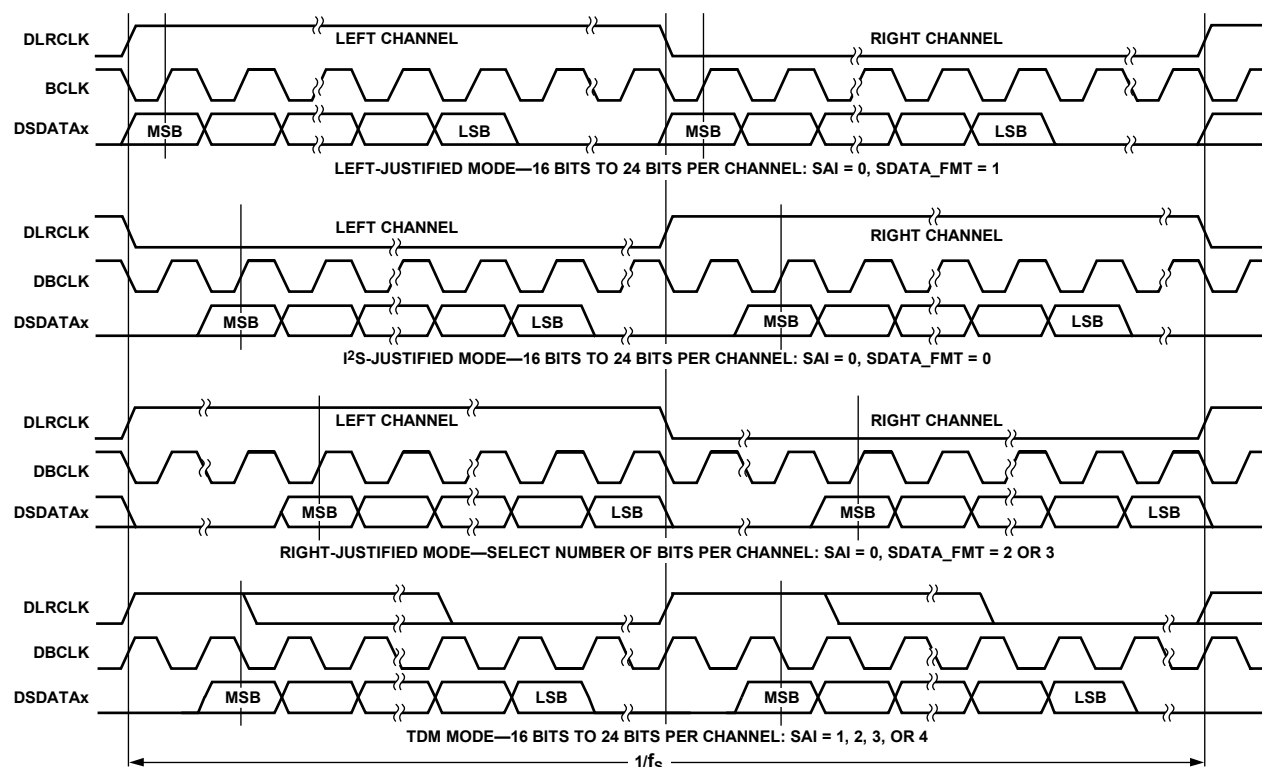

Figure 18. Stereo and TDM Serial Audio Modes

Table 23. Pin Function Changes in Different Serial Audio Interface (SAI) Modes

Signal	Stereo Modes (SAI = 0 or SAI = 1)	TDM4 Mode (SAI = 2)	TDM8 Mode (SAI = 3)	TDM16 Mode (SAI = 4)

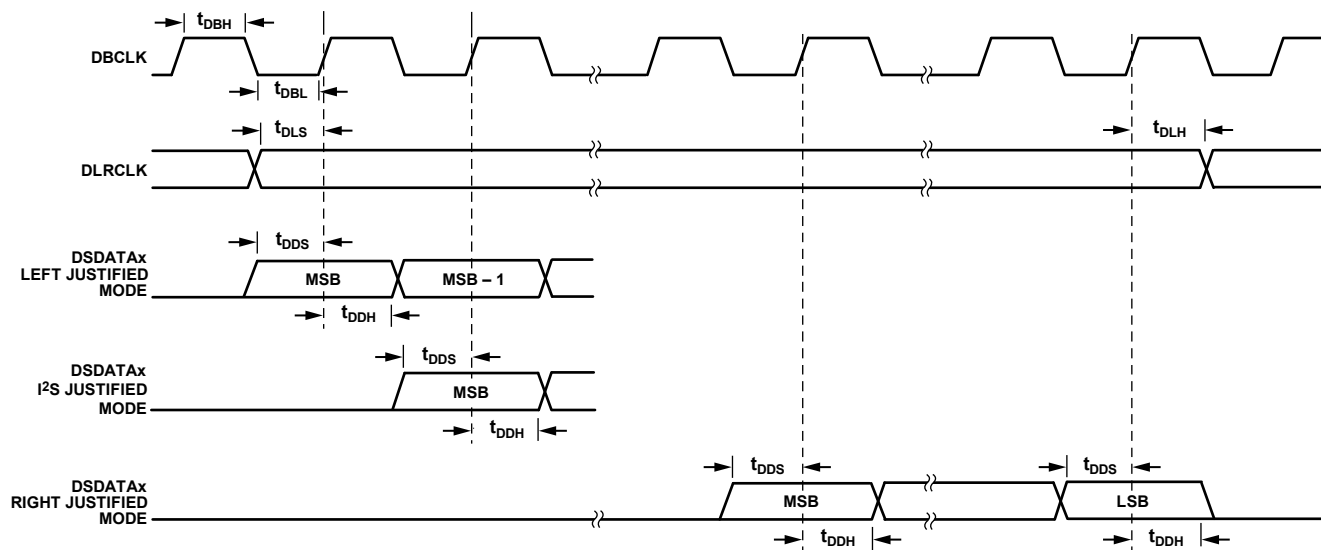

Figure 19. DAC Serial Timing

TEMPERATURE SENSOR

The ADAU1962 has an on-board temperature sensor that allows the user to read the temperature of the silicon inside of the device. The temperature sensor readout has a range of -60°C to $+140^{\circ}\text{C}$ in 1°C steps. The PDN_THRMSSENS_CTRL_1 register controls the settings of the sensor.

The temperature sensor powers on by default and can be shut off by setting the TS_PDN bit to 1 in the PDN_THRMSSENS_CTRL_1 register. The temperature sensor can run in either continuous operation or one shot mode. The temperature sensor conversion mode is modified using Bit 5, THRM_MODE; the default is THRM_MODE = 1, one shot mode. In one shot mode, writing a 0 followed by writing a 1 to Bit 4, THRM_GO, results in a single reset and temperature conversion, placing the resulting temperature data in the THRM_TEMP_STAT register.

In continuous operation mode, the data conversion takes place at a rate set by Bits[7:6], THRM_RATE, with a range of 0.5 sec to 4 sec between samples. Faster rates are possible using one shot mode.

When a temperature conversion is placed in the THRM_TEMP_STAT register, the data can be translated into degrees Celsius ($^{\circ}\text{C}$) using the following steps:

1. Convert the binary or hexadecimal data read from THRM_TEMP_STAT into decimal form.
2. Subtract 60 from the converted THRM_TEMP_STAT data (TEMP); this is the temperature of the silicon in $^{\circ}\text{C}$.

ADDITIONAL MODES

The ADAU1962 offers several additional modes for board level design enhancements. To reduce the EMI in the board level design, serial data can be transmitted without an explicit bit clock input on the DBCLK pin. See Figure 20 for an example of a DAC data transmission in TDM mode that does not require a high speed bit clock or an external master clock. This configuration is applicable when the ADAU1962 master clock is generated by the PLL with the DLRCLK pin as the PLL reference frequency.

To relax the requirement for the setup time of the ADAU1962 in cases of high speed TDM data transmission, the ADAU1962 can latch in the data using the falling edge of the DBCLK pin; see the BCLK_EDGE bit in the DAC_CTRL1 register. This effectively dedicates the entire bit clock period to the setup time. This mode is useful in cases where the source has a large delay time in the serial data driver. Figure 21 shows this inverted bit clock mode of data transmission.

REGISTER DETAILS

PLL AND CLOCK CONTROL 0 REGISTER

Address: 0x00, Reset: 0x00, Name: PLL_CLK_CTRL0

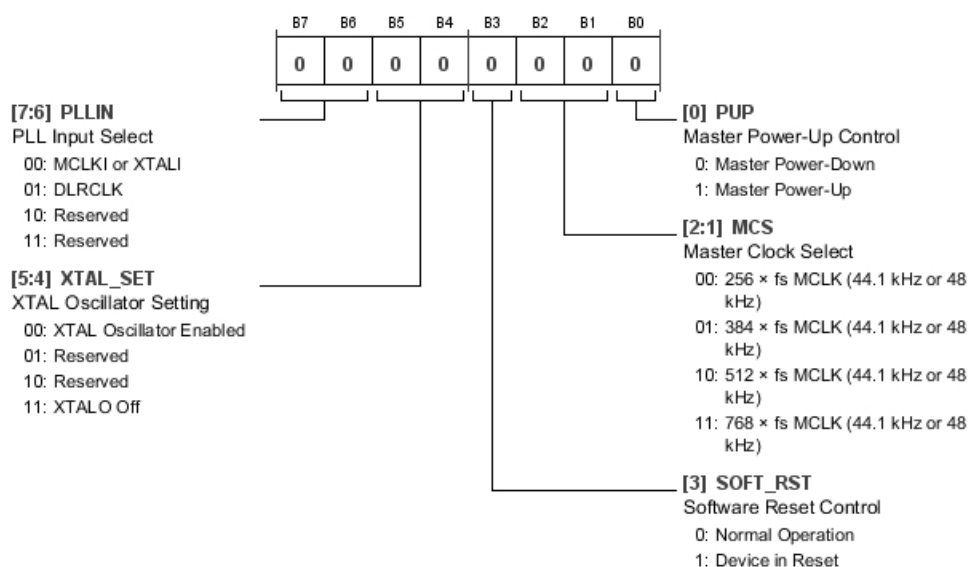

Table 25. Bit Descriptions for PLL_CLK_CTRL0

Bit No.	Bit Name	Settings	Description	Reset	Access
[7:6]	PLLIN	00 MCLKI or XTALI. 01 DLRCLK. 10 Reserved. 11 Reserved.	PLL Input Select. Selects MCLKI/XTALI or DLRCLK pins as the input to the PLL.	0x0	RW
[5:4]	XTAL_SET	00 XTAL Oscillator Enabled. 01 Reserved. 10 Reserved. 11 XTALO Off.	XTAL Oscillator Setting. XTALO pin status.	0x0	RW
3	SOFT_RST	0 Normal Operation. 1 Device in Reset.	Software Reset Control. This bit resets all circuitry inside the integrated circuit, except I ² C/SPI communications. All control registers are reset to default values, except Register 0x00 and Register 0x01. The PLL_CLK_CTRLx registers do not change state.	0x0	RW
[2:1]	MCS	00 $256 \times f_s$ MCLK (44.1 kHz or 48 kHz). 01 $384 \times f_s$ MCLK (44.1 kHz or 48 kHz). 10 $512 \times f_s$ MCLK (44.1 kHz or 48 kHz). 11 $768 \times f_s$ MCLK (44.1 kHz or 48 kHz).	Master Clock Select. MCLKI/XTALI pin functionality (PLL active), master clock rate setting. The following values are for the f_s rate range from 32 kHz to 48 kHz. See Table 12 for details when using other f_s selections.	0x0	RW
0	PUP	0 Master Power-Down. 1 Master Power-Up.	Master Power-Up Control. This bit must be set to 1 as the first register write to power up the IC.	0x0	RW

PLL AND CLOCK CONTROL 1 REGISTER

Address: 0x01, Reset: 0x2A, Name: PLL_CLK_CTRL1

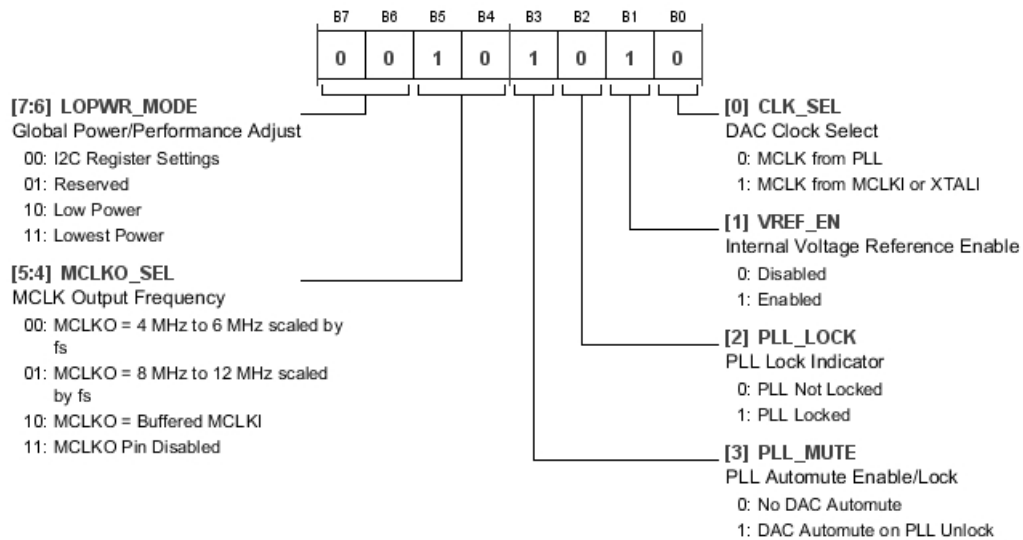

Table 26. Bit Descriptions for PLL_CLK_CTRL1

Bit No.	Bit Name	Settings	Description	Reset	Access
[7:6]	LOPWR_MODE	00 01 10 11	Global Power/Performance Adjust. These bits adjust the power consumption and performance level for all 12 DAC channels simultaneously. See the Digital-to-Analog Converters (DACs) section for more details. I ² C register settings. Reserved. Low Power. Lowest Power.	0x0	RW
[5:4]	MCLKO_SEL	00 01 10 11	MCLKO Output Frequency. Frequency selection for MCLKO pin. See the Clock Signals section for more details. MCLKO = 4 MHz to 6 MHz scaled by f_s . MCLKO = 8 MHz to 12 MHz scaled by f_s . MCLKO = Buffered MCLKI. MCLKO Pin Disabled.	0x2	RW
3	PLL_MUTE	0 1	PLL Automute Enable/Lock. This bit enables the PLL lock automute function. No DAC Automute. DAC Automute on PLL Unlock.	0x1	RW
2	PLL_LOCK	0 1	PLL Lock Indicator. PLL Not Locked. PLL Locked.	0x0	R
1	VREF_EN	0 1	Internal Voltage Reference Enable. The internal voltage reference powers the common mode for the ADAU1962. Disabling this bit allows the user to drive the CM pin with an outside voltage source. Disabled. Enabled.	0x1	RW
0	CLK_SEL	0 1	DAC Clock Select. Selects PLL or direct master clock mode. MCLK from PLL. MCLK from MCLKI or XTALI.	0x0	RW

BLOCK POWER-DOWN AND THERMAL SENSOR CONTROL 1 REGISTER

Address: 0x02, Reset: 0xA0, Name: PDN_THRMSSENS_CTRL_1

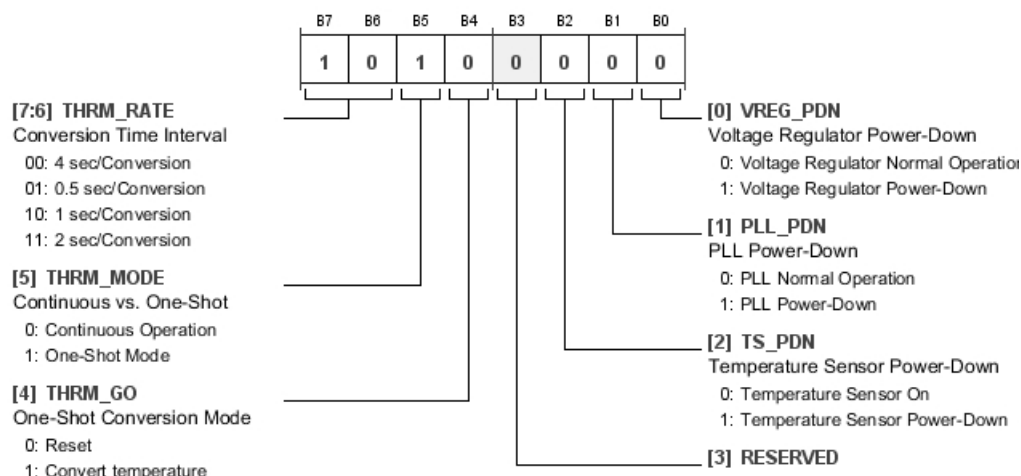

Table 27. Bit Descriptions for PDN_THRMSSENS_CTRL_1

Bit No.	Bit Name	Settings	Description	Reset	Access
[7:6]	THRM_RATE	00 4 sec/Conversion. 01 0.5 sec/Conversion. 10 1 sec/Conversion. 11 2 sec/Conversion.	Conversion Time Interval. When THRM_MODE = 0, the THRM_RATE bits control the time interval between temperature conversions.	0x2	RW
5	THRM_MODE	0 Continuous Operation. 1 One Shot Mode.	Continuous vs. One Shot. This bit determines whether the temperature conversions occur continuously or only when commanded. To perform one shot temperature conversions, set this bit to 1.	0x1	RW
4	THRM_GO	0 Reset. 1 Convert Temperature.	One Shot Conversion Mode. When in one shot conversion mode, THRM_MODE = 1, the THRM_GO bit must be set to 0 followed by a write of 1. This sequence results in a single temperature conversion. The temperature data is available 120 ms after writing a 1 to this bit.	0x0	RW
2	TS_PDN	0 Temperature Sensor On. 1 Temperature Sensor Power-Down.	Temperature Sensor Power-Down.	0x0	RW
1	PLL_PDN	0 PLL Normal Operation. 1 PLL Power-Down.	PLL Power-Down.	0x0	RW
0	VREG_PDN	0 Voltage Regulator Normal Operation. 1 Voltage Regulator Power-Down.	Voltage Regulator Power-Down.	0x0	RW

POWER-DOWN CONTROL 2 REGISTER

Address: 0x03, Reset: 0x00, Name: PDN_CTRL2

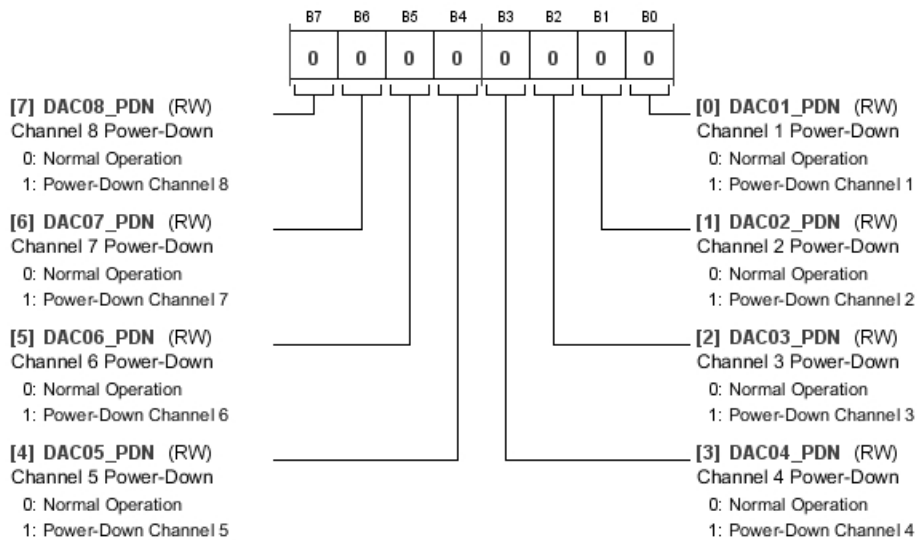

Table 28. Bit Descriptions for PDN_CTRL2

Bit No.	Bit Name	Settings	Description	Reset	Access
7	DAC08_PDN	0 1	Channel 8 Power-Down Normal Operation Power-Down Channel 8	0x0	RW
6	DAC07_PDN	0 1	Channel 7 Power-Down Normal Operation Power-Down Channel 7	0x0	RW
5	DAC06_PDN	0 1	Channel 6 Power-Down Normal Operation Power-Down Channel 6	0x0	RW
4	DAC05_PDN	0 1	Channel 5 Power-Down Normal Operation Power-Down Channel 5	0x0	RW
3	DAC04_PDN	0 1	Channel 4 Power-Down Normal Operation Power-Down Channel 4	0x0	RW
2	DAC03_PDN	0 1	Channel 3 Power-Down Normal Operation Power-Down Channel 3	0x0	RW
1	DAC02_PDN	0 1	Channel 2 Power-Down Normal Operation Power-Down Channel 2	0x0	RW
0	DAC01_PDN	0 1	Channel 1 Power-Down Normal Operation Power-Down Channel 1	0x0	RW

POWER-DOWN CONTROL 3 REGISTER

Address: 0x04, Reset: 0x00, Name: PDN_CTRL3

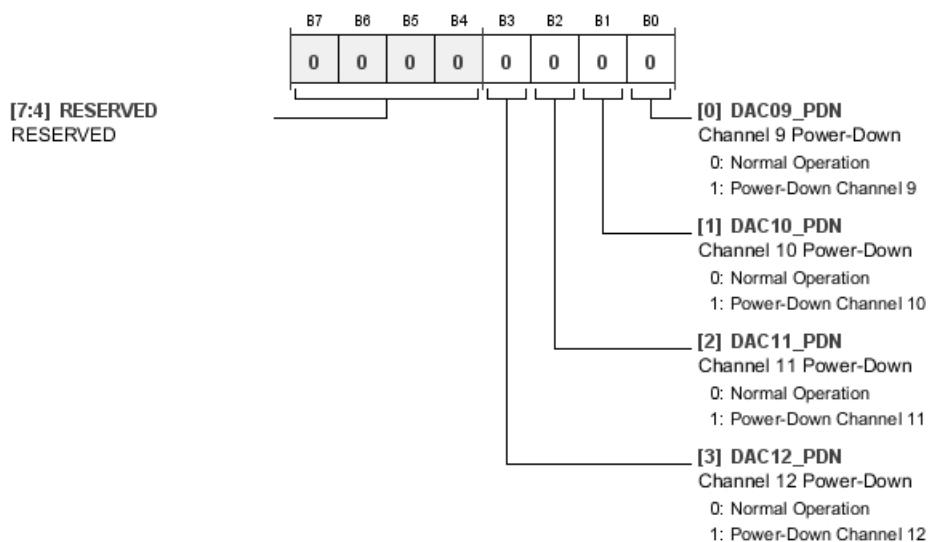

Table 29. Bit Descriptions for PDN_CTRL3

Bit No.	Bit Name	Settings	Description	Reset	Access
3	DAC12_PDN	0 1	Channel 12 Power-Down Normal Operation Power-Down Channel 12	0x0	RW
2	DAC11_PDN	0 1	Channel 11 Power-Down Normal Operation Power-Down Channel 11	0x0	RW
1	DAC10_PDN	0 1	Channel 10 Power-Down Normal Operation Power-Down Channel 10	0x0	RW
0	DAC09_PDN	0 1	Channel 9 Power-Down Normal Operation Power-Down Channel 9	0x0	RW

THERMAL SENSOR TEMPERATURE READOUT REGISTER

Address: 0x05, Reset: 0x00, Name: THRM_TEMP_STAT

The thermal sensor temperature readout range is -60°C to $+140^{\circ}\text{C}$ with a 1°C step size. Read this register and convert the hexadecimal or binary TEMP bit value into decimal form; then subtract 60 from this decimal conversion. The result is the temperature in degrees Celsius.

Table 30. Bit Descriptions for THRM_TEMP_STAT

Bit No.	Bit Name	Settings	Description	Reset	Access
[7:0]	TEMP		Thermal Sensor Temperature Readout. -60°C to $+140^{\circ}\text{C}$ range, 1°C step size. To convert the TEMP code to temperature, use the equation $(\text{TEMP} - 60)$.	0x00	R

DAC CONTROL 0 REGISTER

Address: 0x06, Reset: 0x01, Name: DAC_CTRL0

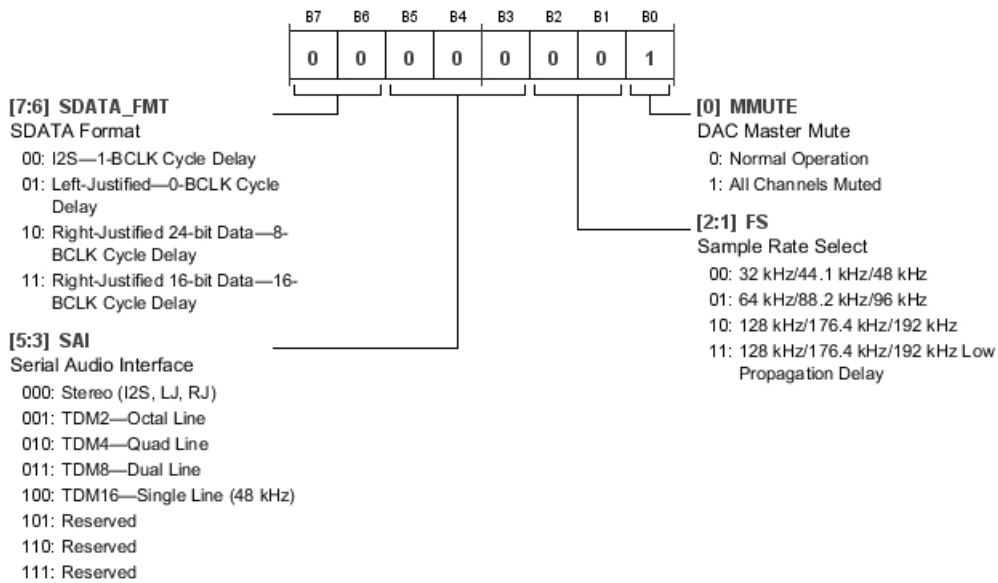

Table 31. Bit Descriptions for DAC_CTRL0

Bit No.	Bit Name	Settings	Description	Reset	Access
[7:6]	SDATA_FMT	00 01 10 11	SDATA Format. Only used when SAI = 000. I2S = 1 BCLK Cycle Delay. Left Justified = 0 BCLK Cycle Delay. Right Justified 24-Bit Data = 8 BCLK Cycle Delay. Right Justified 16-Bit Data = 16 BCLK Cycle Delay.	0x0	RW
[5:3]	SAI	000 001 010 011 100 101 110 111	Serial Audio Interface. When SAI = 000, the SDATA_FMT bits control the stereo SDATA format. Stereo (I2S, left justified, right justified). TDM2 = Octal Line. TDM4 = Quad Line. TDM8 = Dual Line. TDM16 = Single Line (48 kHz). Reserved. Reserved. Reserved.	0x0	RW
[2:1]	FS	00 01 10 11	Sample Rate Select. 32 kHz/44.1 kHz/48 kHz. 64 kHz/88.2 kHz/96 kHz. 128 kHz/176.4 kHz/192 kHz. 128 kHz/176.4 kHz/192 kHz Low Propagation Delay.	0x0	RW
0	MMUTE	0 1	DAC Master Mute. Normal Operation. All Channels Muted.	0x1	RW

DAC CONTROL 1 REGISTER

Address: 0x07, Reset: 0x00, Name: DAC_CTRL1

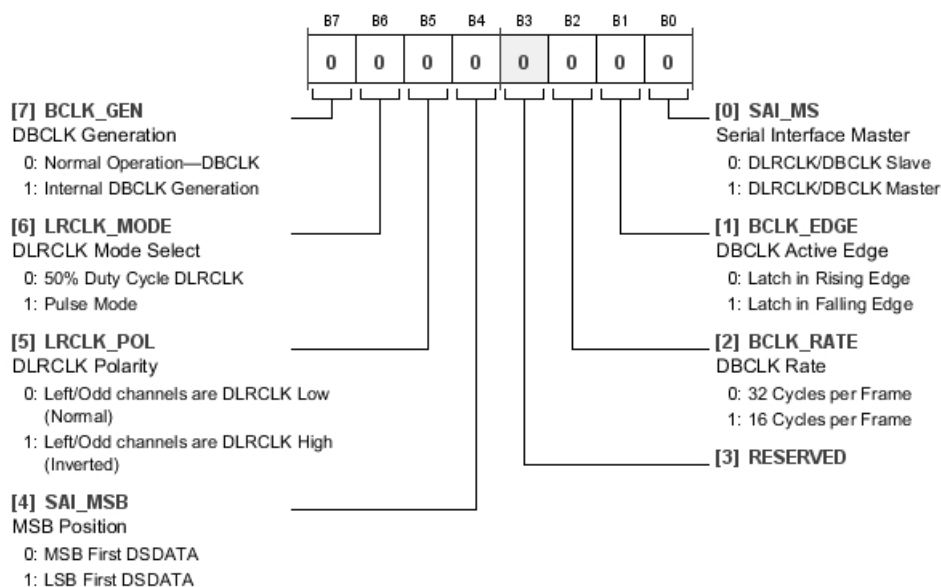

Table 32. Bit Descriptions for DAC_CTRL1

Bit No.	Bit Name	Settings	Description	Reset	Access
7	BCLK_GEN	0 1	DBCLK Generation. When the PLL is locked to the DLRCLK pin, it is possible to run the ADAU1962 without an external bit clock. 0 Normal Operation—DBCLK. 1 Internal DBCLK Generation.	0x0	RW
6	LRCLK_MODE	0 1	DLRCLK Mode Select. Only valid for TDM modes. 0 50% Duty Cycle DLRCLK. 1 Pulse Mode.	0x0	RW
5	LRCLK_POL	0 1	DLRCLK Polarity. Allows the swapping of data between channels. 0 Left/Odd Channels Are DLRCLK Low (Normal). 1 Left/Odd Channels Are DLRCLK High (Inverted).	0x0	RW
4	SAI_MSB	0 1	MSB Position. 0 MSB First DSDATAx. 1 LSB First DSDATAx.	0x0	RW
2	BCLK_RATE	0 1	DBCLK Rate. Number of bit clock cycles per channel slot. Used only for generating bit clock in master mode operation (SAI_MS = 1). 0 32 Cycles per Frame. 1 16 Cycles per Frame.	0x0	RW
1	BCLK_EDGE	0 1	DBCLK Active Edge. Adjusts the polarity of the bit clock leading edge. 0 Latch in Rising Edge. 1 Latch in Falling Edge.	0x0	RW
0	SAI_MS	0 1	Serial Interface Master. Both the DLRCLK and DBCLK pins become the master when enabled. 0 DLRCLK/DBCLK Slave. 1 DLRCLK/DBCLK Master.	0x0	RW

DAC CONTROL 2 REGISTER

Address: 0x08, Reset: 0x06, Name: DAC_CTRL2

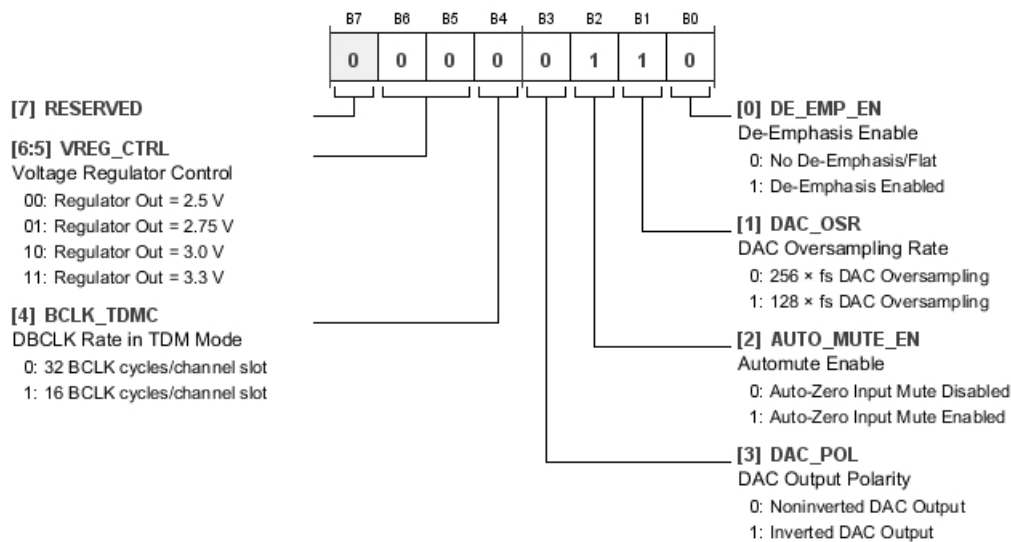

Table 33. Bit Descriptions for DAC_CTRL2

Bit No.	Bit Name	Settings	Description	Reset	Access
[6:5]	VREG_CTRL	00 01 10 11	Voltage Regulator Control. Selects the regulator output voltage. Regulator Output = 2.5 V. Regulator Output = 2.75 V. Regulator Output = 3.0 V. Regulator Output = 3.3 V.	0x0	RW
4	BCLK_TDMC	0 1	DBCLK Rate in TDM Mode. Number of bit clock cycles per channel slot when in TDM mode. 32 BCLK Cycles/Channel Slot. 16 BCLK Cycles/Channel Slot.	0x0	RW
3	DAC_POL	0 1	DAC Output Polarity. This is a global switch of DAC polarity. Noninverted DAC Output. Inverted DAC Output.	0x0	RW
2	AUTO_MUTE_EN	0 1	Automute Enable. Automatically mutes the DACs when 1024 consecutive zero input samples are received. This is independent per channel. Auto-Zero Input Mute Disabled. Auto-Zero Input Mute Enabled.	0x1	RW
1	DAC_OSR	0 1	DAC Oversampling Rate (OSR). OSR selection. 256 × f _s DAC Oversampling. 128 × f _s DAC Oversampling.	0x1	RW
0	DE_EMP_EN	0 1	De-Emphasis Enable. No De-Emphasis/Flat. De-Emphasis Enabled.	0x0	RW

DAC INDIVIDUAL CHANNEL MUTES 1 REGISTER

Address: 0x09, Reset: 0x00, Name: DAC_MUTE1

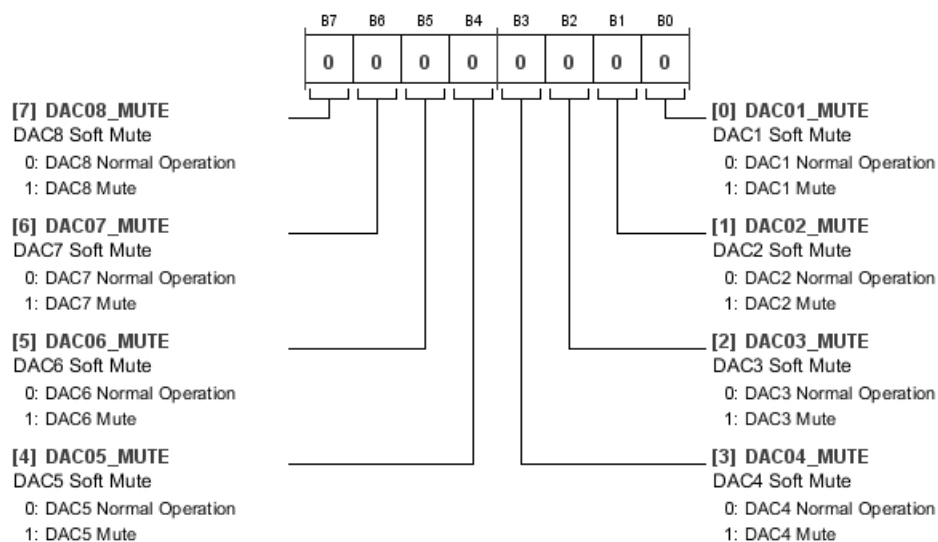

Table 34. Bit Descriptions for DAC_MUTE1

Bit No.	Bit Name	Settings	Description	Reset	Access

Dimensions shown in millimeters

ORDERING GUIDE

Model ^{1,2}	Temperature Range	Package Description	Package Option
ADAU1962WBSTZ	−40°C to +105°C	80-Lead LQFP	ST-80-2
ADAU1962WBSTZRL	−40°C to +105°C	80-Lead LQFP, 13" Tape and Reel	ST-80-2
EVAL-ADAU1962Z		Evaluation Board	

¹ Z = RoHS Compliant Part.

² W = Qualified for Automotive Applications.

AUTOMOTIVE PRODUCTS

The [ADAU1962W](#) models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.

I²C refers to a communications protocol originally developed by Philips Semiconductors (now NXP Semiconductors).
