

# TMD5 Digital Video Equalizer for DVI/HDMI Cables

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage  $V_{CC}$  .....-0.5V to +4.0V  
 Voltage at All I/O Pins .....-0.5V to ( $V_{CC} + 0.7$ V)  
 Voltage between any CML I/O Complementary Pair ..... $\pm 3.3$ V  
 Continuous Power Dissipation ( $T_A = +70^\circ\text{C}$ )  
 48-Pin TQFP-EP (derate 36.2mW/ $^\circ\text{C}$  above  $+70^\circ\text{C}$ ) ..2896mW

Operating Junction Temperature Range .....-55 $^\circ\text{C}$  to +150 $^\circ\text{C}$   
 Storage Temperature Range .....-55 $^\circ\text{C}$  to +150 $^\circ\text{C}$   
 Die Attach Temperature .....+400 $^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

( $V_{CC} = +3.0$ V to +3.6V,  $T_A = 0^\circ\text{C}$  to +70 $^\circ\text{C}$ . Typical Values are at  $V_{CC} = +3.3$ V, external terminations = 50 $\Omega \pm 1\%$ , TMD5 rate = 250Mbps to 1.65Gbps,  $T_A = +25^\circ\text{C}$ , unless otherwise noted.)

**Note 1:** AC specifications are guaranteed by design and characterization.

**Note 2:** Cable input swing is 800mV to 1400mV differential peak-to-peak. Residual output jitter is defined as peak-to-peak deterministic jitter + 14.2 times random jitter.

**Note 3:** Test pattern is a  $2^7 - 1$  PRBS + 20 ones +  $2^7 - 1$  PRBS (inverted) + 20 zeros.

## Typical Operating Characteristics

(Typical values are at  $V_{CC} = +3.3V$ ,  $T_A = +25^\circ C$ , data pattern =  $2^7 - 1$  PRBS + 20 ones +  $2^7 - 1$  PRBS (inverted) + 20 zeros, unless otherwise noted.)

| 14                                        | RXC_IN+             | Positive Clock Input, CML                                                                                                                                                                                                                                                                                                                                    |
| 15                                        | RXC_IN-             | Negative Clock Input, CML                                                                                                                                                                                                                                                                                                                                    |
| 17                                        | EQCONTROL           | Equalizer Control. This pin allows the user to control the equalization level of the MAX3815. Connect the pin to GND for automatic operation. Set the voltage to $V_{CC} / 2$ for minimum equalization, or set the voltage between $V_{CC} - 1V$ to $V_{CC}$ for manual equalization. See the <i>Typical Operating Characteristics</i> for more information. |
| 18                                        | $\overline{CLKLOS}$ | Loss-of-Clock Signal Output, LVTTTL Open Collector. This pin asserts low upon loss of the input TMDS clock from the cable.                                                                                                                                                                                                                                   |
| 19                                        | $\overline{PWRDWN}$ | Power-Down Input, LVTTTL. This input allows the IC to be powered down to conserve power. Connect high for normal operation. Pull low for power-down mode.                                                                                                                                                                                                    |

# TMDS Digital Video Equalizer for DVI/HDMI Cables

## Pin Description (continued)

| PIN                                                 | NAME                      | FUNCTION                                                                                                                                                                                                                    |

| 27                                                  | RX2_OUT-                  | Negative Data Output, CML                                                                                                                                                                                                   |
| 30                                                  | RX1_OUT+                  | Positive Data Output, CML                                                                                                                                                                                                   |
| 31                                                  | RX1_OUT-                  | Negative Data Output, CML                                                                                                                                                                                                   |
| 34                                                  | RX0_OUT+                  | Positive Data Output, CML                                                                                                                                                                                                   |
| 35                                                  | RX0_OUT-                  | Negative Data Output, CML                                                                                                                                                                                                   |
| 39                                                  | OUTLEVEL                  | Output-Level Control Input, LVTTTL. This input sets the output amplitude to the standard DVI level (1000mV <sub>p-p</sub> ) when high, and sets the output amplitude to 1/2 the DVI level (500mV <sub>p-p</sub> ) when low. |
| 40                                                  | $\overline{\text{OUTON}}$ | Output-Enable Control Input, LVTTTL. This input enables the CML outputs when forced low and sets a differential logic zero when forced high.                                                                                |
| 45–48                                               | N.C.                      | No Connection                                                                                                                                                                                                               |
| EP                                                  | Exposed Pad               | Ground. The exposed pad must be soldered to the circuit-board ground for proper thermal and electrical operation.                                                                                                           |

## Detailed Description

The MAX3815 TMDS equalizer accepts differential CML input data at rates of 250Mbps up to 1.65Gbps (individual channel data rate). It automatically adjusts to attenuation levels of up to 40dB at 825MHz due to skin-effect losses in copper cable. It consists of four CML input buffers, a loss-of-clock signal detector, three independent adaptive equalizers, four limiting amplifiers, and four output buffers (Figure 1).

### CML Input Buffers and Output Drivers

The input buffers and the output drivers are implemented using current-mode logic (CML) (see Figures 3 and 4). The output drivers are open-collector and can be turned off with the  $\overline{\text{OUTON}}$  pin, or can be set to output a one-half amplitude signal (500mV<sub>p-p</sub> differential) using the OUTLEVEL pin. For details on interfacing with CML, refer to Maxim Application Note *HFAN-01.0: Introduction to LVDS, PECL, and CML*.

### Loss-of-Clock Signal Detector

The loss-of-clock signal detector indicates a loss-of-clock signal at the CLKLOS pin.

### Adaptive Equalizer

The three data channels each contain an independent adaptive equalizer. Each channel analyzes the incoming signal and determines the amount of equalization to apply.

### Limiting Amplifier

The limiting amplifier amplifies the signal from the adaptive equalizer and truncates the top and bottom of the waveform to provide a clean high- and low-level signal to the output drivers.

## Applications Information

Typical shielded twisted pair (STP) and unshielded twisted pair (UTP) cables exhibit skin-effect losses, which attenuate the high-frequency spectrum of a TMDS signal, eventually causing data errors or even closing the signal eye altogether given a long enough cable. The MAX3815 recovers the data and opens the signal eye through compensating equalization.

The basic TMDS interface is composed of four differential serial links: three links carry serial data up to 1.65Gbps each, and the fourth is a one-tenth-rate (0.1x) clock that operates up to 165MHz. TMDS, as with

# TMDS Digital Video Equalizer for DVI/HDMI Cables

MAX3815

Figure 1. Functional Diagram

analog nVGA links, must handle a variety of resolutions and screen update rates. The actual range of digital serial rates is roughly 250Mbps to 1.65Gbps. For applications requiring ultra-high resolutions (e.g., QXGA), a “double-link” TMDS interface is used and is composed of six data links plus the clock, requiring two MAX3815 ICs with the clock going to both ICs. See Figure 2.

The MAX3815 can be used to extend any TMDS interface as used under the following trademarked names: DVI (digital visual interface), DFP™ (digital flat-panel), Panellink, ADC™ (Apple display connector), and HDMI (high-definition multimedia interface).

## Loss-of-Clock Signal (CLKLOS) Output

Loss-of-clock signal is indicated by the  $\overline{\text{CLKLOS}}$  output. A low level on  $\overline{\text{CLKLOS}}$  indicates that the signal power on the RXC\_IN pins has dropped below a threshold. When there is sufficient input voltage to the channel (typically greater than 100mVp-p differential),  $\overline{\text{CLKLOS}}$  is high. The  $\overline{\text{CLKLOS}}$  output is suitable for indicating problems with the transmission link caused by, for example, a broken cable, a defective driver, or a lost connection to the equalizer.

DFP is a trademark of Video Electronics Standards Association (VESA).

# TMD5 Digital Video Equalizer for DVI/HDMI Cables

A squelching function can be created by sending the CLKLOS output through an inverter to the  $\overline{\text{OUTON}}$  pin. This will squelch the CML outputs whenever the clock signal is removed. A loss-of-signal LED indicator can be incorporated into the circuit as well (see Figure 3).

## Output Level Control (OUTLEVEL) Input

The OUTLEVEL pin is an LVTTTL input that allows the user to select between standard output amplitude (1000mVp-p differential) or one-half output amplitude (500mVp-p differential). Forcing this pin high results in the standard output signal level, and forcing this pin low results in the reduced output signal level.

## Equalizer Control (EQCONTROL) Input

The EQCONTROL pin allows the user to control the equalization in one of three ways: forcing the pin to ground sets the equalizer in automatic equalization mode, forcing the pin to  $V_{CC} / 2$  sets the equalizer to minimum equalization, and forcing a voltage between  $V_{CC} - 1V$  to  $V_{CC}$  allows manual control of the equalization level applied to the input signals. See the *Typical Operating Characteristics* for more information.

## Power-Down (PWRDWN) Input

The PWRDWN pin allows the part to be powered down to reduce system power consumption. Force the pin high for normal operation. Force the pin low to power-down the IC. When powered down, the part consumes approximately 10mA.

Figure 3. Squelch Circuit

## Output On ( $\overline{\text{OUTON}}$ ) Input

The  $\overline{\text{OUTON}}$  pin is an LVTTTL input. Force the pin low to enable the outputs. Force the pin high to set a differential zero on the outputs. When disabled, the outputs will go to a differential zero, irrespective of the signal at the inputs.

## Cable Selection

TMD5 performance is heavily dependent on cable quality. Deterministic jitter (DJ) can be caused by differential-to-common-mode conversion (or vice-versa)

## Interface Models

within a twisted pair (STP or UTP), usually a result of cable twist or dielectric imbalance. Refer to Application Note *HFAN-04.5.4: 'Jitter Happens' when a Twisted Pair is Unbalanced* for more information.

## Layout Considerations

The data and clock inputs are the most critical paths for the MAX3815 and great care should be taken to minimize discontinuities on these transmission lines between the connector and the IC. Here are some suggestions for maximizing the performance of the MAX3815:

- The data and clock inputs should be wired directly between the cable connector and IC without stubs.

- Input and output data channel designations are only a guide. Polarity assignments can be swapped and channel paths can be interchanged.
- An uninterrupted ground plane should be positioned beneath the high-speed I/Os.
- Ground-path vias should be placed close to the IC and the input/output interfaces to allow a return current path to the IC and the DVI cable.
- Maintain 100Ω differential transmission line impedance into and out of the MAX3815.
- Use good high-frequency layout techniques and multilayer boards with an uninterrupted ground plane to minimize EMI and crosstalk.

## Exposed-Pad Package

The exposed pad on the 48-pin TQFP-EP provides a very low thermal resistance path for heat removal from the IC. The pad is also electrical ground on the MAX3815 and must be soldered to the circuit board ground for proper thermal and electrical performance. Refer to Maxim Application Note *HFAN-08.1: Thermal Considerations of QFN and Other Exposed-Paddle Packages* for additional information.
