ABSOLUTE MAXIMUM RATINGS

V _{DD} to GND	0.3V to +17V
REF to GND	±25V
RFB to GND	±25V
Digital Inputs to GND	0.3V to (V _{DD} + 0.3V)
OUT1, OUT2 to GND	0.3V to V _{DD}

Operating Temperature Ranges	
MAX5480_CEE	0°C to +70°C
MAX5480_EEE	40°C to +85°C
Storage Temperature Range	65°C to +160°C
Continuous Power Dissipation (TA = +70°C	
MAX5480EE (derate 8.3mW/°C above	
Lead Temperature (soldering 10sec)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{DD} = +5V, V_{REF} = +10V, V_{OUT1} = V_{OUT2} = 0V, Circuit of Figure 1, T_A = T_{MIN} to T_{MAX}, unless otherwise noted.)

Note 1: Gain error is measured using internal feedback resistor. Full-scale range (FSR) = V_{REF} .

Note 2: Gain TempCo measured from $+25^{\circ}$ C to T_{MAX} and from $+25^{\circ}$ C to T_{MIN}.

Note 3: Guaranteed by design.

Pin Description

PIN	NAME	FUNCTION						
1	OUT1	R-2R Ladder Output						
2	OUT2	R-2R Ladder Output, complement of OUT1						
3	GND	Ground						
4–11	D7-D0	Data Inputs, D7 is the most significant bit.						
12	CS	Chip Select Input. Active Low.						
13	WR	Write Control Input. Active Low.						
14	V _{DD}	Power Supply Input, +5V						
15	REF	Reference Voltage Input						
16	RFB	Feedback Resistor Connection						

_Detailed Description

The MAX5480 is an 8-bit multiplying digital-to-analog converter (DAC) that consists of a thin-film R-2R resistor array with CMOS current steering switches. Figure 3 shows a simplified schematic of the DAC. The inverted R-2R ladder divides the voltage or current reference in a binary manner among the eight steering switches. The magnitude of the current appearing at either OUT terminal depends on the number of switches selected; therefore, the output is an analog representation of the digital input. The two OUT terminals must be held at the same potential so a constant current is maintained in each ladder leg. This makes the REF input current independent of switch state and also ensures that the MAX5480 maintains its excellent linearity performance.

Interface-Logic Information

Mode Selection

The inputs $\overline{\text{CS}}$ and $\overline{\text{WR}}$ control the MAX5480's operating mode (see Table 1).

Write Mode

When \overline{CS} and \overline{WR} are both low, the MAX5480 is in write mode, and its analog output responds to data activity at the D0–D7 data-bus inputs. In this mode, the data latches are transparent (see Tables 2 and 3).

Hold Mode

In hold mode, the MAX5480 retains the data that was present on D0–D7 just prior to \overline{CS} or \overline{WR} assuming a high state. The analog output remains at the value corresponding to the digital code locked in the data latch.

Applications Information

Using the MAX5480 in Voltage-Output Mode (Single Supply)

The MAX5480 can be used either as a current-output DAC (Figures 1 and 6) or as a voltage-output DAC (Figures 2 and 5).

To use the MAX5480 in voltage mode, connect OUT1 to the reference input and connect OUT2 to ground. REF, now the DAC output, is a voltage source with a constant output resistance of $10k\Omega$ (nominally). This output is often buffered with an op amp (Figure 5).

An advantage of voltage-mode operation is singlesupply operation for the complete circuit; i.e., a negative reference is not required for a positive output. It is important to note that the range of the reference is restricted in voltage mode. The reference input (voltage at OUT1) must always be positive and is limited to no more than V_{DD} - 3V. If the reference voltage exceeds this value, linearity is degraded.

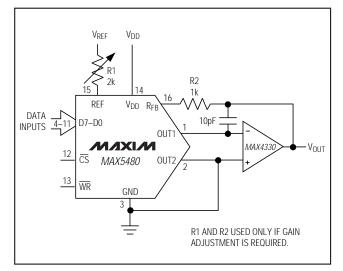

Figure 1. Unipolar Binary Operation (Two-Quadrant Multiplication)

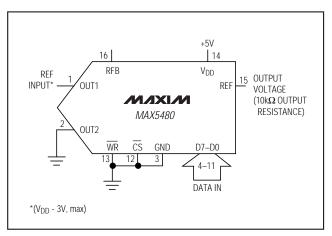

Figure 2. Typical Operating Circuit (Voltage Mode—Unbuffered)

Table 1. Mode-Selection Table

CS	WR	MODE	DAC Response
L	L	Write	DAC responds to data bus (D0–D7) inputs.
H X	X H	Hold Hold	Data bus (D0–D7) is locked out; DAC holds last data present when CS or WR assumed high state.

L = Low State, H = High State, X = Don't Care

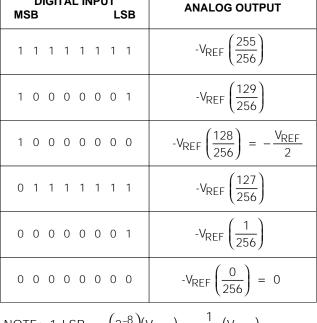

Δ

Table 3. Bipolar (Offset Binary) Code Table

DIGITAL INPUT MSB LSB							SB	ANALOG OUTPUT
1	1	1	1	1	1	1	1	$+V_{\text{REF}}\left(\frac{127}{128}\right)$
1	0	0	0	0	0	0	1	$+V_{\text{REF}}\left(\frac{1}{128}\right)$
1	0	0	0	0	0	0	0	0
0	1	1	1	1	1	1	1	$-V_{REF}\left(\frac{1}{128}\right)$
0	0	0	0	0	0	0	1	$-V_{REF}\left(\frac{127}{128}\right)$
0	0	0	0	0	0	0	0	$-V_{REF}\left(\frac{128}{128}\right)$
NOTE: 1 LSB = $(2^{-7})(V_{REF}) = \frac{1}{128}(V_{REF})$
