

# Low-Power Dual-/Triple-Voltage SC70 $\mu$ P Supervisory Circuits

## ABSOLUTE MAXIMUM RATINGS

V<sub>CC1</sub>, V<sub>CC2</sub>, POK1 to GND .....-0.3V to +6V  
 Open-Drain RESET, PFO to GND .....-0.3V to +6V  
 Push-Pull RESET to GND .....-0.3V to (V<sub>CC1</sub> + 0.3V)  
 MR, RSTIN, PFI to GND .....-0.3V to (V<sub>CC1</sub> + 0.3V)  
 Input/Output Current, All Pins .....20mA  
 Continuous Power Dissipation (T<sub>A</sub> = +70°C)  
   5-Pin SC70 (derate 3.1mW/°C above +70°C) .....247mW

Operating Temperature Range .....-40°C to +85°C  
 Junction Temperature .....+150°C  
 Storage Temperature Range .....-65°C to +150°C  
 Lead Temperature (soldering, 10s) .....+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = 1.2V to 5.5V, T<sub>A</sub> = -40°C to +85°C, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.) (Note 1)

**Note 1:** All devices are 100% tested at  $T_A = +25^{\circ}C$ . All temperature limits are guaranteed by design.

**Note 2:** Guaranteed by design.

**Note 3:**  $t_{PD}$  timeout period begins after POK1 timeout period ( $t_{POKP}$ ) and  $V_{CC2} \geq V_{TH2}$  (max) (MAX6741/MAX6744).

**Note 4:** Refers to the manual reset function obtained by forcing the RESET output low.

**Note 5:**  $V_{CC1} \geq 1.6V$ .

| 1                  | 1                  | 1                  | 1                  | 1                  | $\overline{\text{RESET}}$ | Reset Output, Push-Pull or Open Drain Active Low. $\overline{\text{RESET}}$ changes from high to low when any monitored power-supply input ( $V_{CC1}$ , $V_{CC2}$ , RSTIN) drops below its selected reset threshold. It remains low until all monitored power-supply inputs exceed their selected reset thresholds for the $V_{CC}$ reset timeout period. $\overline{\text{RESET}}$ is forced low if $\overline{\text{MR}}$ is low for at least the $\overline{\text{MR}}$ minimum input pulse width. It remains low for the $\overline{\text{MR}}$ reset timeout period after $\overline{\text{MR}}$ goes high. The push-pull output is referenced to $V_{CC1}$ . The MAX6736/MAX6738 open-drain outputs require an external pullup resistor. The MAX6740/MAX6741/MAX6742 open-drain outputs have an internal 50k $\Omega$ pullup resistor to $V_{CC1}$ and provide a manual reset function. |

# Low-Power Dual-/Triple-Voltage SC70 $\mu$ P Supervisory Circuits

Figure 1. Timing Diagram

## Detailed Description

### Supply Voltages

The MAX6736–MAX6745  $\mu$ P supervisory circuits maintain system integrity by alerting the  $\mu$ P to fault conditions. These devices are optimized for systems that monitor two or three supply voltages. The reset output state is guaranteed to remain valid while either VCC1 or VCC2 is above 1.2V.

### Threshold Levels

The MAX6736/MAX6737/MAX6740/MAX6741/MAX6743/MAX6744 input voltage threshold combinations are indicated by a two-letter code in Table 1. The MAX6738/MAX6739/MAX6742/MAX6745 input voltage thresholds are indicated by a one-letter code in Table 2. Contact the factory for the availability of other voltage thresholds.

### Reset Output

The MAX6736–MAX6745 provide an active-low reset output (RESET). RESET is asserted when the voltage at either VCC1 or VCC2 falls below the voltage threshold level, RSTIN drops below the threshold, or MR is pulled low. Once reset is asserted, it stays low for the reset timeout period. If VCC1, VCC2, or RSTIN goes below the reset threshold before the reset timeout period is completed, the internal timer restarts. The MAX6736/MAX6738/MAX6740/MAX6741/MAX6742 have open-drain reset outputs, while the MAX6737/MAX6739/MAX6743/MAX6744/MAX6745 have push-pull reset outputs (Figure 1).

The MAX6740/MAX6741/MAX6742 include a  $\overline{\text{RESET}}$  output with a manual reset detect function. The open-drain  $\overline{\text{RESET}}$  output has an internal  $50\text{k}\Omega$  pullup to VCC1. The RESET output is low while the output is pulled to GND and remains low for at least the manual reset timeout period after the external GND pulldown is

# Low-Power Dual-/Triple-Voltage SC70 $\mu$ P Supervisory Circuits

Figure 2. MAX6740/MAX6741/MAX6742 Manual Reset Timing Diagram

released. The manual reset detect function is internally debounced for the  $t_{DEB}$  timeout period, so the output can be connected directly to a momentary pushbutton switch, if desired (Figure 2).

## Manual Reset Input

Many microprocessor-based products require manual reset capability, allowing the operator, a test technician, or external logic circuitry to initiate a reset while the monitored supplies remain above their reset thresholds. The MAX6736-MAX6739 have a dedicated active-low  $\overline{MR}$  input. The  $\overline{RESET}$  is asserted low while  $\overline{MR}$  is held low and remains asserted for the manual reset timeout period after  $\overline{MR}$  returns high. The  $\overline{MR}$  input has an internal  $1.5k\Omega$  pullup resistor to  $V_{CC1}$  and can be left unconnected if not used.  $\overline{MR}$  can be driven with CMOS logic levels, open-drain/open-collector outputs, or a momentary pushbutton switch to GND to create a manual reset function.

## Adjustable Input Voltage

The MAX6738/MAX6739 and MAX6740/MAX6743 provide an additional input to monitor a second or third system voltage. The threshold voltage at  $RSTIN$  is typi-

cally 488mV. Connect a resistor-divider network to the circuit as shown in Figure 3 to establish an externally controlled threshold voltage,  $V_{EXT\_TH}$ .

$$V_{EXT\_TH} = 0.488V((R1 + R2) / R2)$$

Low leakage current at  $RSTIN$  allows the use of large-valued resistors, resulting in reduced power consumption of the system.

## Power-Fail Comparator

PFI is the noninverting input to an auxiliary comparator. A 488mV internal reference ( $V_{TH-PFI}$ ) is connected to the inverting input of the comparator. If PFI is less than 488mV, PFO is asserted low. PFO deasserts without a timeout period when PFI rises above the externally set threshold. Common uses for the power-fail comparator include monitoring for low battery conditions or a failing DC-DC converter input voltage (see the *Typical Application Circuits*). The asserted PFO output can place a system in a low-power suspend mode or support an orderly system shutdown before monitored  $V_{CC}$  voltages drop below the reset thresholds. Connect PFI to an external resistor-divider network as shown in Figure 4 to set the desired trip threshold. Connect PFI to  $V_{CC1}$  if unused.

## Applications Information

### Interfacing to the $\mu$ P with Bidirectional Reset Pins

Most microprocessors with bidirectional reset pins can interface directly to open-drain  $\overline{RESET}$  output options. Systems simultaneously requiring a push-pull  $\overline{RESET}$  output and a bidirectional reset interface can be in logic contention. To prevent contention, connect a  $4.7k\Omega$  resistor between  $\overline{RESET}$  and the  $\mu$ P's reset I/O port as shown in Figure 5.

Figure 3. Monitoring an Additional Voltage

# Low-Power Dual-/Triple-Voltage SC70 $\mu\text{P}$ Supervisory Circuits

Figure 4. Using Power-Fail Input to Monitor an Additional Power Supply

## Adding Hysteresis to the Power-Fail Comparator

The power-fail comparator has a typical input hysteresis of 2.5mV. This is sufficient for most applications in which a power-supply line is being monitored through an external voltage-divider. If additional noise margin is desired, connect a resistor between  $\overline{\text{PFO}}$  and PFI, as

Figure 5. Interfacing to  $\mu\text{Ps}$  with Bidirectional Reset I/O

shown in Figure 6. Select the values of R1, R2, and R3 such that PFI sees  $V_{\text{TH-PFI}}$  (488mV) when  $V_{\text{EXT}}$  falls to its power-fail trip point ( $V_{\text{FAIL}}$ ) and when  $V_{\text{EXT}}$  rises to its power-good trip point ( $V_{\text{GOOD}}$ ). The hysteresis window extends between the specified  $V_{\text{FAIL}}$  and  $V_{\text{GOOD}}$  thresholds. R3 adds the additional hysteresis by sinking current from the R1/R2 divider network when the  $\overline{\text{PFO}}$  output is logic low and sourcing current into the network when  $\overline{\text{PFO}}$  is logic high. R3 is typically an order of magnitude greater than R1 or R2.

The current through R2 should be at least 1 $\mu\text{A}$  to ensure that the 10nA (max) PFI input current does not significantly shift the trip points. Therefore, for most applications:

$$R2 < V_{\text{TH-PFI}} / 1\text{mA} < 0.488\text{V} / 1\text{mA} < 488\text{k}\Omega$$

$\overline{\text{PFO}}$  is an open-drain output requiring an external pullup resistor, R4. Select R4 to be less than 1% of R3.

$V_{\text{GOOD}}$  = DESIRED  $V_{\text{EXT}}$  GOOD VOLTAGE THRESHOLD

$V_{\text{FAIL}}$  = DESIRED  $V_{\text{EXT}}$  FAIL VOLTAGE THRESHOLD

$V_{\text{PU}} = V_{\text{PULLUP}}$  (FOR OPEN-DRAIN  $\overline{\text{PFO}}$ )

$R2 = 488\text{k}\Omega$  (FOR  $>1\mu\text{A}$  R2 CURRENT)

$$R1 = R2 \frac{(V_{\text{GOOD}} - V_{\text{TH-PFI}}) - \frac{(V_{\text{TH-PFI}}(V_{\text{GOOD}} - V_{\text{FAIL}}))}{V_{\text{PU}}}}{V_{\text{TH}} - \text{PFI}}$$

$$R3 = (R1 \times V_{\text{PU}}) / (V_{\text{GOOD}} - V_{\text{FAIL}})$$

$$R4 \leq 0.01 \times R3$$

## Power Sequencing Applications

Many dual-voltage processors/ASICs require specific power-up/power-down sequences for the I/O and core supplies.

Figure 6. Adding Hysteresis to Power Fail for Push-Pull  $\overline{\text{PFO}}$

# Low-Power Dual-/Triple-Voltage SC70 $\mu$ P Supervisory Circuits

The MAX6741/MAX6744 offer a  $V_{CC1}$  POK (POK1) ideal for  $V_{CC1}$ -to- $V_{CC2}$  sequencing. POK1 remains low as long as  $V_{CC1}$  is below its  $V_{TH1}$  threshold. When  $V_{CC1}$  exceeds  $V_{TH1}$  for the POK1 timeout period ( $t_{POKP}$ ), the open-drain POK1 output is deasserted. The POK1 output can then enable the  $V_{CC2}$  power supply (use an external POK1 pullup resistor).  $\overline{RESET}$  is deasserted when both  $V_{CC1}$  and  $V_{CC2}$  remain above their selected thresholds for the reset timeout period ( $t_{RP}$ ). The POK1 output can be used for I/O before core or core before I/O sequencing, depending on the selected  $V_{CC1}/V_{CC2}$  thresholds. See the *Typical Application Circuit* and Figure 1.

## Monitoring a Negative Voltage

The power-fail comparator can be used to monitor a negative supply voltage using the circuit shown in Figure 4. When the negative supply is valid,  $\overline{PFO}$  is low. When the negative supply voltage drops,  $\overline{PFO}$  goes high. The circuit's accuracy is affected by the PFI threshold tolerance,  $V_{CC}$ , R1, and R2.

## Transient Immunity

The MAX6736–MAX6745 supervisors are relatively immune to short-duration falling  $V_{CC}$  transients (glitches). It is usually undesirable to reset the  $\mu$ P when  $V_{CC}$  experiences only small glitches. The *Typical Operating Characteristics* show Maximum  $V_{CC1}/V_{CC2}$  Transient Duration vs. Reset Threshold Overdrive, for which reset pulses are not generated. The graph shows the maximum pulse width that a falling  $V_{CC}$  transient might typically have without causing a reset pulse to be issued. As the amplitude of the transient increases, the maximum allowable pulse width decreases. A 0.1 $\mu$ F bypass capacitor mounted close to the  $V_{CC}$  pin provides additional transient immunity.

| MAX6744XK_D_-T | -40°C to +85°C | 5 SC70-5    |
| MAX6745XK_D_-T | -40°C to +85°C | 5 SC70-5    |

**Note:** The first “\_” or “\_” are placeholders for the threshold voltage levels of the devices. Desired threshold levels are set by the part number suffix found in Tables 1 and 2. The “\_” after the D is a placeholder for the reset timeout period suffix found in Table 3. For example, the MAX6736XKLT D3-T is a dual-voltage supervisor  $V_{TH1} = 4.625V$ ,  $V_{TH2} = 3.075V$ , and a 150ms minimum reset timeout period. All devices are available in tape-and-reel only. There is a 2500-piece minimum order increment for standard versions (see Table 1). Sample stock is typically held on standard versions only. Nonstandard versions require a minimum order increment of 10,000 pieces. Contact factory for availability.

Devices are available in both leaded and lead-free packaging. Specify lead-free by replacing “-T” with “+T” when ordering.

# Low-Power Dual-/Triple-Voltage SC70 $\mu$ P Supervisory Circuits

## Package Information

(The package drawing(s) in this data sheet may not reflect the most current specifications. For the latest package outline information, go to [www.maxim-ic.com/packages](http://www.maxim-ic.com/packages).)

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
