

MB95200H/210H is a series of general-purpose, single-chip microcontrollers. In addition to a compact instruction set, the microcontrollers of this series contain a variety of peripheral resources.

Features

F²MC-8FX CPU core

Instruction set optimized for controllers

- Multiplication and division instructions
- 16-bit arithmetic operations
- Bit test branch instructions
- Bit manipulation instructions, etc.

Clock (main OSC clock and sub-OSC clock are only available in MB95F204H/F204K/F203H/F203K/F202H/F202K)

- Selectable main clock source
 - Main OSC clock (up to 16.25 MHz, maximum machine clock frequency: 8.125 MHz)
 - External clock (up to 32.5 MHz, maximum machine clock frequency: 16.25 MHz)
 - Main internal CR clock (1/8/10 MHz ± 3%, maximum machine clock frequency: 10 MHz)
- Selectable subclock source
 - Sub-OSC clock (32.768 kHz)
 - External clock (32.768 kHz)
 - Sub-internal CR clock (Typ: 100 kHz, Min: 50 kHz, Max: 200 kHz)

Timer

- 8/16-bit composite timer
- Timebase timer
- Watch prescaler

LIN-UART (MB95F204H/F204K/F203H/F203K/F202H/F202K)

- Full duplex double buffer
 - Capable of clock-synchronized serial data transfer and clock-asynchronous serial data transfer

External interrupt

- Interrupt by edge detection (rising edge, falling edge, and both edges can be selected)
- Can be used to wake up the device from different low-power consumption (standby) modes

8/10-bit A/D converter

- 8-bit or 10-bit resolution can be selected.

Low power consumption (standby) mode

- Stop mode
- Sleep mode
- Watch mode
- Timebase timer mode

I/O port (Max: 17) (MB95F204K/F203K/F202K)

- General-purpose I/O ports (Max):
CMOS I/O: 15, N-ch open drain: 2

I/O port (Max: 16) (MB95F204H/F203H/F202H)

- General-purpose I/O ports (Max):
CMOS I/O: 15, N-ch open drain: 1

I/O port (Max: 5) (MB95F214K/F213K/F212K)

- General-purpose I/O ports (Max):
CMOS I/O: 3, N-ch open drain: 2

I/O port (Max: 4) (MB95F214H/F213H/F212H)

- General-purpose I/O ports (Max):
CMOS I/O: 3, N-ch open drain: 1

On-chip debug

- 1-wire serial control
- Serial writing supported (asynchronous mode)

Hardware/software watchdog timer

- Built-in hardware watchdog timer

Low-voltage detection reset circuit

- Built-in low-voltage detector

Clock supervisor counter

- Built-in clock supervisor counter function

Programmable port input voltage level

- CMOS input level / hysteresis input level

Flash memory security function

- Protects the contents of flash memory

3. Differences Among Products And Notes On Product Selection

Current consumption

When using the on-chip debug function, take account of the current consumption of flash erase/program.

For details of current consumption, see "18.Electrical Characteristics".

Package

For details of information on each package, see "2.Packages and Corresponding Products" and "22.Package Dimensions".

Operating voltage

The operating voltage varies, depending on whether the on-chip debug function is used or not.

For details of the operating voltage, see "18.Electrical Characteristics".

On-chip debug function

The on-chip debug function requires that V_{CC}, V_{SS} and 1 serial-wire be connected to an evaluation tool. In addition, if the flash memory data has to be updated, the RSTX/PF2 pin must also be connected to the same evaluation tool.

9. Notes on Device Handling

Preventing latch-ups

When using the device, ensure that the voltage applied does not exceed the maximum voltage rating.

In a CMOS IC, if a voltage higher than V_{CC} or a voltage lower than V_{SS} is applied to an input/output pin that is neither a medium-withstand voltage pin nor a high-withstand voltage pin, or if a voltage out of the rating range of power supply voltage mentioned in "18.1 Absolute Maximum Ratings" of Electrical Characteristics" is applied to the V_{CC} pin or the V_{SS} pin, a latch-up may occur.

When a latch-up occurs, power supply current increases significantly, which may cause a component to be thermally destroyed.

Stabilizing supply voltage

Supply voltage must be stabilized.

A malfunction may occur when power supply voltage fluctuates rapidly even though the fluctuation is within the guaranteed operating range of the V_{CC} power supply voltage.

As a rule of voltage stabilization, suppress voltage fluctuation so that the fluctuation in V_{CC} ripple (p-p value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the standard V_{CC} value, and the transient fluctuation rate does not exceed 0.1 V/ms at a momentary fluctuation such as switching the power supply.

Notes on using the external clock

When an external clock is used, oscillation stabilization wait time is required for power-on reset, wake-up from subclock mode or stop mode.

10. Pin Connection

Treatment of unused pins

If an unused input pin is left unconnected, a component may be permanently damaged due to malfunctions or latch-ups. Always pull up or pull down an unused input pin through a resistor of at least 2 k Ω . Set an unused input/output pin to the output state and leave it unconnected, or set it to the input state and treat it the same as an unused input pin. If there is an unused output pin, leave it unconnected.

Power supply pins

To reduce unnecessary electro-magnetic emission, prevent malfunctions of strobe signals due to an increase in the ground level, and conform to the total output current standard, always connect the V_{CC} pin and the V_{SS} pin to the power supply and ground outside the device. In addition, connect the current supply source to the V_{CC} pin and the V_{SS} pin with low impedance.

It is also advisable to connect a ceramic bypass capacitor of approximately 0.1 μ F between the V_{CC} pin and the V_{SS} pin at a location close to this device.

DBG pin

Connect the DBG pin directly to an external pull-up resistor.

To prevent the device from unintentionally entering the debug mode due to noise, minimize the distance between the DBG pin and the V_{CC} or V_{SS} pin when designing the layout of the printed circuit board.

The DBG pin should not stay at "L" level after power-on until the reset output is released.

RSTX pin

Connect the RSTX pin directly to an external pull-up resistor.

To prevent the device from unintentionally entering the reset mode due to noise, minimize the distance between the RSTX pin and the V_{CC} or V_{SS} pin when designing the layout of the printed circuit board.

The RSTX/PF2 pin functions as the reset input/output pin after power-on. In addition, the reset output can be enabled by the RSTOE bit of the SYSC register, and the reset input function or the general purpose I/O function can be selected by the RSTEN bit of the SYSC register.

C pin

Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The bypass capacitor for the V_{CC} pin must have a capacitance larger than C_S . For the connection to a smoothing capacitor C_S , see the diagram below. To prevent the device from unintentionally entering an unknown mode due to noise, minimize the distance between the C pin and C_S and the distance between C_S and the V_{SS} pin when designing the layout of a printed circuit board.

18.1 Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	V_{CC}	$V_{SS}-0.3$	$V_{SS}+6$	V	
Input voltage*1	V_{I1}	$V_{SS}-0.3$	$V_{CC}+0.3$	V	Other than PF2*2
	V_{I2}	$V_{SS}-0.3$	10.5	V	PF2
Output voltage*1	V_O	$V_{SS}-0.3$	$V_{SS}+6$	V	*2
Maximum clamp current	I_{CLAMP}	-2	+2	mA	Applicable to pins listed in *3
Total maximum clamp current	$\Sigma I_{CLAMP} $	—	20	mA	Applicable to pins listed in *3
“L” level maximum output current	I_{OL1}	—	15	mA	Other than P05, P06, P62 and P63*4
	I_{OL2}		15		P05, P06, P62 and P63*4
“L” level average current	I_{OLAV1}	—	4	mA	Other than P05, P06, P62 and P63*4 Average output current = operating current × operating ratio (1 pin)
	I_{OLAV2}		12		P05, P06, P62 and P63*4 Average output current = operating current × operating ratio (1 pin)
“L” level total maximum output current	ΣI_{OL}	—	100	mA	
“L” level total average output current	ΣI_{OLAV}	—	50	mA	Total average output current = operating current × operating ratio (Total number of pins)
“H” level maximum output current	I_{OH1}	—	-15	mA	Other than P05, P06, P62 and P63*4
	I_{OH2}		-15		P05, P06, P62 and P63*4
“H” level average current	I_{OHAV1}	—	-4	mA	Other than P05, P06, P62 and P63*4 Average output current = operating current × operating ratio (1 pin)
	I_{OHAV2}		-8		P05, P06, P62 and P63*4 Average output current = operating current × operating ratio (1 pin)
“H” level total maximum output current	ΣI_{OH}	—	-100	mA	
“H” level total average output current	ΣI_{OHAV}	—	-50	mA	Total average output current = operating current × operating ratio (Total number of pins)
Power consumption	P_d	—	320	mW	
Operating temperature	T_A	-40	+85	°C	
Storage temperature	T_{stg}	-55	+150	°C	

- *1: The parameter is based on $V_{SS} = 0.0\text{ V}$.
- *2: V_I and V_O must not exceed $V_{CC} + 0.3\text{ V}$. V_I must not exceed the rated voltage. However, if the maximum current to/from an input is limited by means of an external component, the I_{CLAMP} rating is used instead of the V_I rating.
- *3: Applicable to the following pins: P00 to P07, P62 to P64, PG1, PG2, PF0, PF1 (P00 to P03, P07, P62 to P64, PG1, PG2, PF0 and PF1 are available in MB95F204H/F203H/F202H/F204K/F203K/F202K.)
- Use under recommended operating conditions.
 - Use with DC voltage (current).
 - The HV (High Voltage) signal is an input signal exceeding the V_{CC} voltage. Always connect a limiting resistor between the HV (High Voltage) signal and the microcontroller before applying the HV (High Voltage) signal.
 - The value of the limiting resistor should be set to a value at which the current to be input to the microcontroller pin when the HV (High Voltage) signal is input is below the standard value, irrespective of whether the current is transient current of stationary current.
 - When the microcontroller drive current is low, such as in low power consumption modes, the HV (High Voltage) input potential may pass through the protective diode to increase the potential of the V_{CC} pin, affecting other devices.
 - If the HV (High Voltage) signal is input when the microcontroller power supply is off (not fixed at 0 V), since power is supplied from the pins, incomplete operations may be executed.
 - If the HV (High Voltage) input is input after power-on, since power is supplied from the pins, the voltage of power supply may not be sufficient to enable a power-on reset.
 - Do not leave the HV (High Voltage) input pin unconnected.
 - Example of a recommended circuit:

Input/Output Equivalent Circuit

- *4: P62 and P63 are available in MB95F204H/F203H/F202H/F204K/F203K/F202K.

WARNING: A semiconductor device may be damaged by applying stress (voltage, current, temperature, etc.) in excess of the absolute maximum rating. Therefore, ensure that not a single parameter exceeds its absolute maximum rating.

18.2 Recommended Operating Conditions

 (V_{SS} = 0.0 V)

Parameter	Symbol	Value		Unit	Remarks	
		Min	Max			
Power supply voltage	V _{CC}	2.4*1*2	5.5*1	V	In normal operation	Other than on-chip debug mode
		2.3	5.5		Hold condition in stop mode	
		2.9	5.5		In normal operation	On-chip debug mode
		2.3	5.5		Hold condition in stop mode	
Smoothing capacitor	C _S	0.022	1	μF	*3	
Operating temperature	T _A	-40	+85	°C	Other than on-chip debug function	
		+5	+35		On-chip debug function	

*1: The value varies depending on the operating frequency, the machine clock and the analog guaranteed range.

*2: The value is 2.88 V when the low-voltage detection reset is used.

*3: Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The bypass capacitor for the V_{CC} pin must have a capacitance larger than C_S. For the connection to a smoothing capacitor C_S, see the diagram below. To prevent the device from unintentionally entering an unknown mode due to noise, minimize the distance between the C pin and C_S and the distance between C_S and the V_{SS} pin when designing the layout of a printed circuit board.

● DBG / RSTX / C pin connection diagram

*: Since the DBG pin becomes a communication pin in on-chip debug mode, set a pull-up resistor value suiting the input/output specifications of P12/DBG.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the electrical characteristics of the device are warranted when the device is operated within these ranges. Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact sales representatives beforehand.

*1: The input level of P04 can be switched between “CMOS input level” and “hysteresis input level”. The input level selection register (ILSR) is used to switch between the two input levels.

*2: P62 and P63 are available in MB95F204H/F203H/F202H/F204K/F203K/F202K.

*3: P00 to P03, P07, PG1 and PG2 are available in MB95F204H/F203H/F202H/F204K/F203K/F202K.

*4: The power supply current is determined by the external clock. When the low-voltage detection option is selected, the power-supply current will be the sum of adding the current consumption of the low-voltage detection circuit (I_{LVD}) to a specified value. In addition, when both the low-voltage detection option and the CR oscillator are selected, the power supply current will be the sum of adding up the current consumption of the low-voltage detection circuit, the current consumption of the CR oscillators (I_{CRH} , I_{CRL}) and a specified value. In on-chip debug mode, the CR oscillator (I_{CRH}) and the low-voltage detection circuit are always enabled, and current consumption therefore increases accordingly.

18.5.2 Notes on Using the A/D Converter

External impedance of analog input and its sampling time

- The A/D converter has a sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion precision. Therefore, to satisfy the A/D conversion precision standard, considering the relationship between the external impedance and minimum sampling time, either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. In addition, if sufficient sampling time cannot be secured, connect a capacitor of about 0.1 μF to the analog input pin.

Analog input equivalent circuit

$4.5\text{ V} \leq V_{CC} \leq 5.5\text{ V}$: $R \approx 1.95\text{ k}\Omega$ (Max), $C \approx 17\text{ pF}$ (Max)
 $4.0\text{ V} \leq V_{CC} < 4.5\text{ V}$: $R \approx 8.98\text{ k}\Omega$ (Max), $C \approx 17\text{ pF}$ (Max)

Note: The values are reference values.

Relationship between external impedance and minimum sampling time

A/D conversion error

As $|V_{CC} - V_{SS}|$ decreases, the A/D conversion error increases proportionately.

18.5.3 Definitions of A/D Converter Terms

■ Resolution

It indicates the level of analog variation that can be distinguished by the A/D converter.
 When the number of bits is 10, analog voltage can be divided into $2^{10} = 1024$.

■ Linearity error (unit: LSB)

It indicates how much an actual conversion value deviates from the straight line connecting the zero transition point ("00 0000 0000" $\leftrightarrow$ "00 0000 0001") of a device to the full-scale transition point ("11 1111 1111" $\leftrightarrow$ "11 1111 1110") of the same device.

■ Differential linear error (unit: LSB)

It indicates how much the input voltage required to change the output code by 1 LSB deviates from an ideal value.

■ Total error (unit: LSB)

It indicates the difference between an actual value and a theoretical value. The error can be caused by a zero transition error, a full-scale transition errors, a linearity error, a quantum error, or noise.

(Continued)

(Continued)

$$\text{Linearity error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times N + V_{OT}\}}{1 \text{ LSB}}$$

$$\text{Differential linear error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1$$

N : A/D converter digital output value

V_{NT}: Voltage at which the digital output transits from (N - 1) to N

V_{OT}(ideal value) = V_{SS} + 0.5 LSB [V]

V_{FST}(ideal value) = V_{CC} - 2.0 LSB [V]

18.6 Flash Memory Program/Erase Characteristics

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Chip erase time	—	1* ¹	15* ²	s	00 _H programming time prior to erasure is excluded.
Byte programming time	—	32	3600	μs	System-level overhead is excluded.
Erase/program voltage	9.5	10	10.5	V	The erase/program voltage must be applied to the PF2 pin in erase/program.
Current drawn on PF2	—	—	5.0	mA	Current consumption of PF2 pin during flash memory program/erase
Erase/program cycle	—	100000	—	cycle	
Power supply voltage at erase/program	3.0	—	5.5	V	
Flash memory data retention time	20* ³	—	—	year	Average T _A = +85°C

*1: T_A = +25°C, V_{CC} = 5.0 V, 100000 cycles

*2: T_A = +85°C, V_{CC} = 4.5 V, 100000 cycles

*3: This value is converted from the result of a technology reliability assessment. (The value is converted from the result of a high temperature accelerated test by using the Arrhenius equation with the average temperature being +85°C) .

23. Major Changes

Spansion Publication Number: DS07-12623-5E

Page	Section	Change results
30	Electrical Characteristics 1. Absolute Maximum Ratings	Changed the characteristics of Input voltage.
33	3. DC Characteristics	Corrected the maximum value of "H" level input voltage for PF2 pin. $V_{CC} + 0.3 \rightarrow 10.5$
		Corrected the maximum value of Open-drain output application voltage. $0.2V_{CC} \rightarrow V_{SS} + 5.5$
36		Added the footnote *5.
39	4. AC Characteristics (1) Clock Timing	Added a figure of HCLK1/HCLK2.
42	(2) Source Clock/Machine Clock	Corrected the graph of Operating voltage - Operating frequency (with the on-chip debug function). (Corrected the pitch)
43	(3) External Reset	Added "and power on" to the remarks column.
58	6. Flash Memory Program/Erase Characteristics	Added the row of "Current drawn on PF2".
		Corrected the minimum value of Power supply voltage at erase/program. $4.5 \rightarrow 3.0$
