

2.3 Protection mechanisms

- High ESD robustness: ± 6 kV according to IEC 61000-4-2 for pins LIN, V_{BAT} and WAKE_N
- Transmit data (TXD) dominant time-out function
- Bus terminal and battery pin protected against transients in the automotive environment (ISO 7637)
- Bus terminal short-circuit proof to battery and ground
- Thermally protected

3. Quick reference data

Table 1. Quick reference data

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{BAT}	battery supply voltage	limiting value with respect to GND	-0.3	-	+40	V
I_{BAT}	battery supply current	Sleep mode; $V_{LIN} = V_{BAT}$; $V_{WAKE_N} = V_{BAT}$ $V_{TXD} = 0$ V; $V_{SLP_N} = 0$ V	2	7	10	μ A
		Standby mode; bus recessive $V_{INH} = V_{BAT}$; $V_{LIN} = V_{BAT}$; $V_{WAKE_N} = V_{BAT}$ $V_{TXD} = 0$ V; $V_{SLP_N} = 0$ V	150	450	1000	μ A
		Standby mode; bus dominant $V_{BAT} = 12$ V; $V_{INH} = 12$ V; $V_{LIN} = 0$ V $V_{WAKE_N} = 12$ V; $V_{TXD} = 0$ V; $V_{SLP_N} = 0$ V	300	800	1200	μ A
		Normal mode; bus recessive $V_{INH} = V_{BAT}$; $V_{LIN} = V_{BAT}$; $V_{WAKE_N} = V_{BAT}$ $V_{TXD} = 5$ V; $V_{SLP_N} = 5$ V	300	800	1600	μ A
		Normal mode; bus dominant $V_{BAT} = 12$ V; $V_{INH} = 12$ V; $V_{WAKE_N} = 12$ V $V_{TXD} = 0$ V; $V_{SLP_N} = 5$ V	1	2	4	mA
V_{LIN}	voltage on pin LIN	limiting value with respect to GND, V_{BAT} and V_{WAKE_N}	-40	-	+40	V
T_{vj}	virtual junction temperature	limiting value	-40	-	+150	$^{\circ}$ C

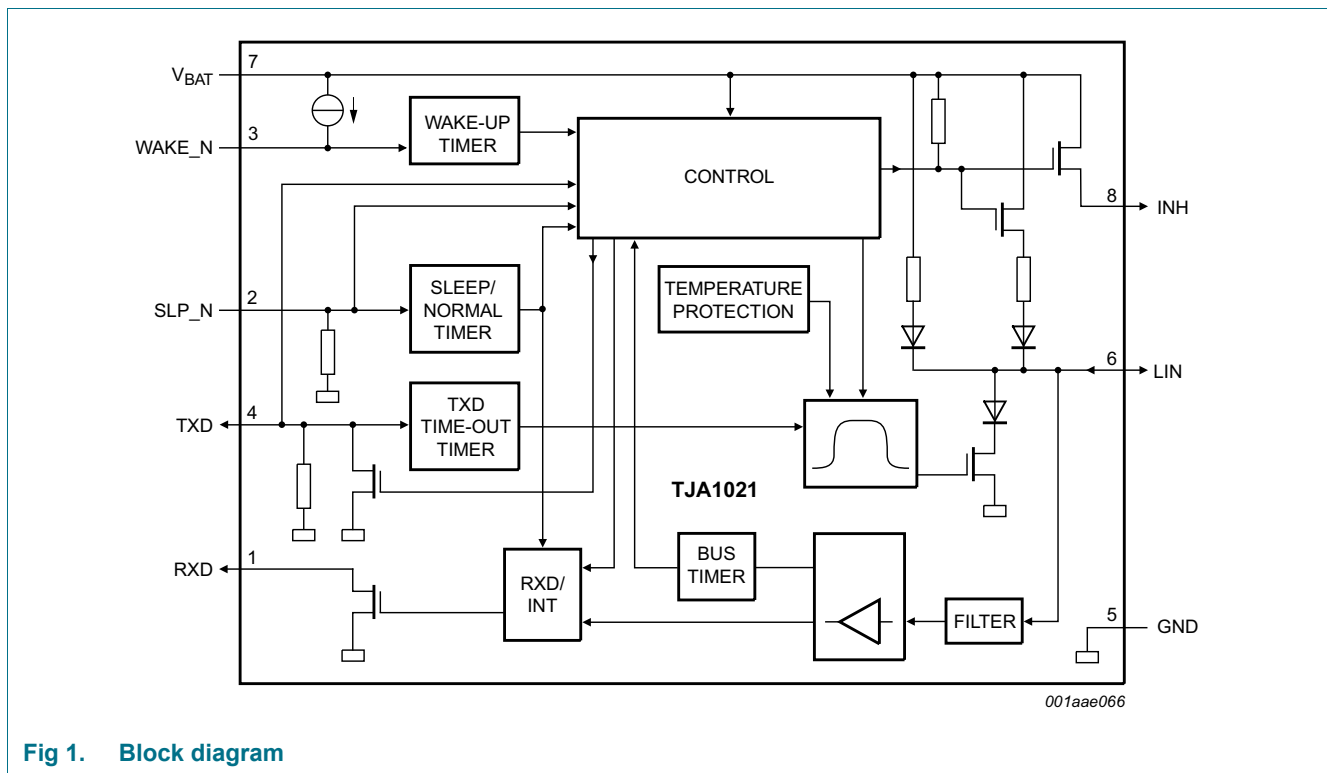

4. Ordering information

Table 2. Ordering information

Type number ^[1]	Package		
	Name	Description	Version
TJA1021T/10 TJA1021T/20	SO8	plastic small outline package; 8 leads; body width 3.9 mm	SOT96-1
TJA1021TK/10 TJA1021TK/20	HVSON8	plastic thermal enhanced very thin small outline package; no leads; 8 terminals; body $3 \times 3 \times 0.85$ mm	SOT782-1

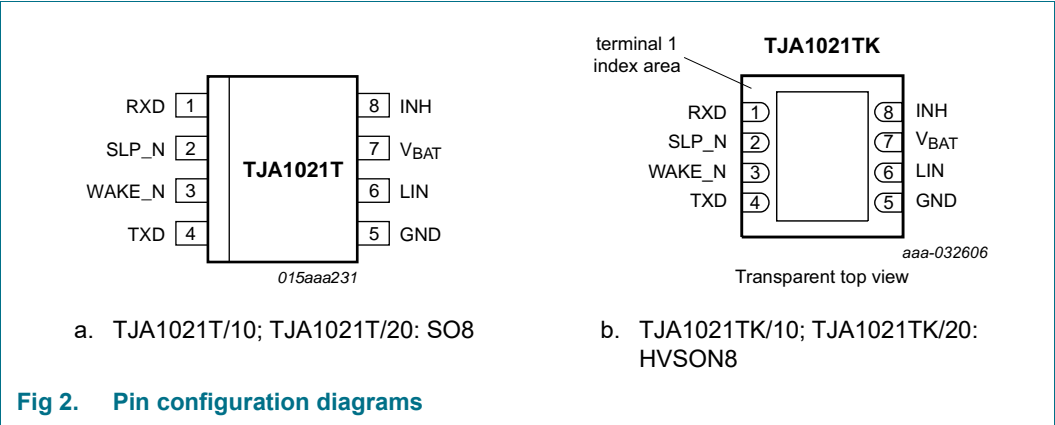

[1] TJA1021T/10 and TJA1021TK/10: for the low slope version that supports baud rates up to 10.4 kBd (SAE J2602);
TJA1021T/20 and TJA1021TK/20: for the normal slope version that supports baud rates up to 20 kBd.

5. Block diagram

6. Pinning information

6.1 Pinning

6.2 Pin description

Table 3. Pin description

Symbol	Pin	Description
RXD	1	receive data output (open-drain); active LOW after a wake-up event
SLP_N	2	sleep control input (active LOW); controls inhibit output; resets wake-up source flag on TXD and wake-up request on RXD
WAKE_N	3	local wake-up input (active LOW); negative edge triggered
TXD	4	transmit data input; active LOW output after a local wake-up event
GND	5 ^[1]	ground
LIN	6	LIN bus line input/output
V _{BAT}	7	battery supply voltage
INH	8	battery related inhibit output for controlling an external voltage regulator; active HIGH after a wake-up event

[1] For enhanced thermal and electrical performance, solder the exposed center pad of the HVSON8 package to board ground.

7. Functional description

The TJA1021 is the interface between the LIN master/slave protocol controller and the physical bus in a Local Interconnect Network (LIN). The TJA1021 is LIN 2.0, LIN 2.1, LIN 2.2, LIN 2.2A, SAE J2602 and ISO 17987-4:2016 (12 V) compliant and provides optimum ElectroMagnetic Compatibility (EMC) performance due to wave shaping of the LIN output.

The LIN physical layer is independent of higher OSI model layers (e.g., the LIN protocol). Consequently, nodes containing an ISO 17987-compliant physical layer can be combined, without restriction, with LIN physical layer nodes that comply with earlier revisions (LIN 1.0, LIN 1.1, LIN 1.2, LIN 1.3, LIN 2.0, LIN 2.1, LIN 2.2 and LIN 2.2A).

The TJA1021T/20 and TJA1021TK/20 are optimized for the maximum specified LIN transmission speed of 20 kBd; the TJA1021T/10 and TJA1021TK/10 are optimized for the LIN transmission speed of 10.4 kBd as specified by the SAE J2602.

7.1 Operating modes

The TJA1021 supports modes for normal operation (Normal mode), power-up (Power-on mode) and very-low-power operation (Sleep mode). An intermediate wake-up mode between Sleep and Normal modes is also supported (Standby mode). [Figure 3](#) shows the state diagram.

Table 4. Operating modes

Mode	SLP_N	TXD (output)	RXD	INH	Transmitter	Remarks
Sleep mode	0	weak pull-down	floating	floating	off	no wake-up request detected
Standby ^[1] mode	0	weak pull-down if remote wake-up; strong pull-down if local wake-up ^[2]	LOW ^[3]	HIGH	off	wake-up request detected; in this mode the microcontroller can read the wake-up source: remote or local wake-up
Normal mode	1	HIGH: recessive state LOW: dominant state	HIGH: recessive state LOW: dominant state	HIGH	Normal mode	^[2] ^[3] ^[4]
Power-on mode	0	weak pull-down	floating	HIGH	off	^[5]

[1] Standby mode is entered automatically upon any local or remote wake-up event during Sleep mode. Pin INH and the 30 kΩ termination resistor at pin LIN are switched on.

[2] The internal wake-up source flag (set if a local wake-up did occur and fed to pin TXD) will be reset after a positive edge on pin SLP_N.

[3] The wake-up interrupt (on pin RXD) is released after a positive edge on pin SLP_N.

[4] Normal mode is entered after a positive edge on SLP_N. As long as TXD is LOW, the transmitter is off. In the event of a short-circuit to ground on pin TXD, the transmitter will be disabled.

[5] Power-on mode is entered after switching on V_{BAT}.

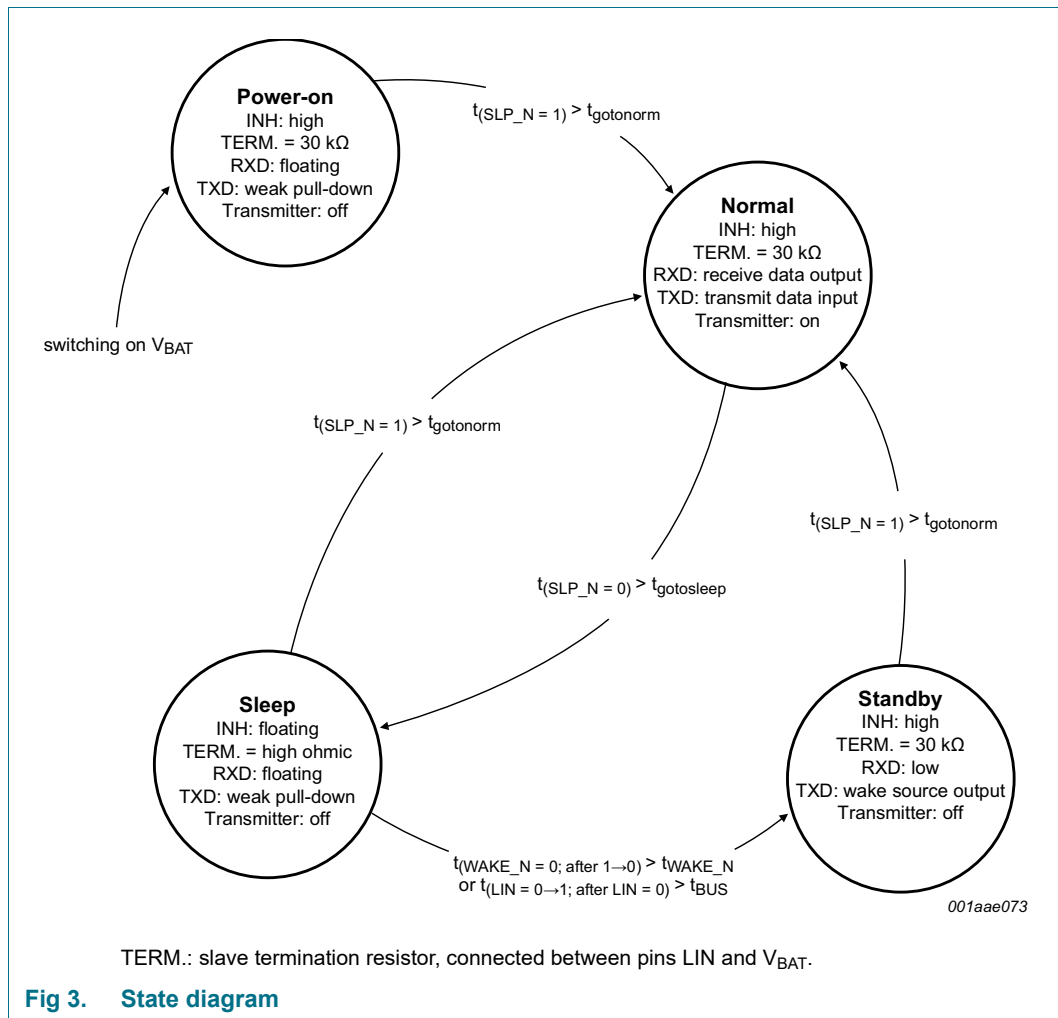

Fig 3. State diagram

7.2 Sleep mode

This mode is the most power-saving mode of the TJA1021. Despite its extreme low current consumption, the TJA1021 can still be woken up remotely via pin LIN, or woken up locally via pin WAKE_N, or activated directly via pin SLP_N. Filters at the inputs of the receiver (LIN), of pin WAKE_N and of pin SLP_N prevent unwanted wake-up events due to automotive transients or EMI. All wake-up events must be maintained for a certain time period ($t_{wake(dom)LIN}$, $t_{wake(dom)WAKE_N}$ and $t_{gotonorm}$).

Sleep mode is initiated by a falling edge on pin SLP_N in Normal mode. To enter Sleep mode successfully (INH becomes floating), the sleep command (pin SLP_N = LOW) must be maintained for at least $t_{gotosleep}$.

In Sleep mode the internal slave termination between pins LIN and V_{BAT} is disabled to minimize the power dissipation in the event that pin LIN is short-circuited to ground. Only a weak pull-up between pins LIN and V_{BAT} is present.

Sleep mode can be activated independently from the actual level on pin LIN, pin TXD or pin WAKE_N. This guarantees that the lowest power consumption is achievable even in case of a continuous dominant level on pin LIN or a continuous LOW on pin WAKE_N.

When V_{BAT} drops below the power-on-reset threshold $V_{th(POR)L}$, the TJA1021 enters Sleep mode.

7.3 Standby mode

Standby mode is entered automatically whenever a local or remote wake-up occurs while the TJA1021 is in Sleep mode. These wake-up events activate pin INH and enable the slave termination resistor at the pin LIN. As a result of the HIGH condition on pin INH the voltage regulator and the microcontroller can be activated.

Standby mode is signalled by a LOW-level on pin RXD which can be used as an interrupt for the microcontroller.

In Standby mode (pin SLP_N is still LOW), the condition of pin TXD (weak pull-down or strong pull-down) indicates the wake-up source: weak pull-down for a remote wake-up request and strong pull-down for a local wake-up request.

Setting pin SLP_N HIGH during Standby mode results in the following events:

- An immediate reset of the wake-up source flag; thus releasing the possible strong pull-down at pin TXD before the actual mode change (after $t_{gotonorm}$) is performed
- A change into Normal mode if the HIGH level on pin SLP_N has been maintained for a certain time period ($t_{gotonorm}$)
- An immediate reset of the wake-up request signal on pin RXD

7.4 Normal mode

In Normal mode the TJA1021 is able to transmit and receive data via the LIN bus line. The receiver detects the data stream at the LIN bus input pin and transfers it via pin RXD to the microcontroller (see [Figure 1](#)): HIGH at a recessive level and LOW at a dominant level on the bus. The receiver has a supply-voltage related threshold with hysteresis and an integrated filter to suppress bus line noise. The transmit data stream of the protocol controller at the TXD input is converted by the transmitter into a bus signal with optimized slew rate and wave shaping to minimize EME. The LIN bus output pin is pulled HIGH via an internal slave termination resistor. For a master application an external resistor in series with a diode should be connected between pin INH or V_{BAT} on one side and pin LIN on the other side (see [Figure 7](#)).

When in Sleep, Standby or Power-up mode, the TJA1021 enters Normal mode whenever a HIGH level on pin SLP_N is maintained for a time of at least $t_{gotonorm}$.

The TJA1021 switches to Sleep mode in case of a LOW-level on pin SLP_N, maintained for a time of at least $t_{gotosleep}$.

7.5 Wake-up

When V_{BAT} exceeds the power-on-reset threshold voltage $V_{th(POR)H}$, the TJA1021 enters Power-on mode. Though the TJA1021 is powered-up and INH is HIGH, both the transmitter and receiver are still inactive. If $SLP_N = 1$ for $t > t_{gotonorm}$, the TJA1021 enters Normal mode.

There are three ways to wake-up a TJA1021 which is in Sleep mode:

1. Remote wake-up via a dominant bus state of at least $t_{wake(dom)LIN}$

2. Local wake-up via a negative edge at pin WAKE_N
3. Mode change (pin SLP_N is HIGH) from Sleep mode to Normal mode

7.6 Remote and local wake-up

A falling edge at pin LIN followed by a LOW level maintained for a certain time period ($t_{\text{wake}(\text{dom})\text{LIN}}$) and a rising edge at pin LIN respectively (see [Figure 4](#)) results in a remote wake-up. It should be noted that the time period $t_{\text{wake}(\text{dom})\text{LIN}}$ is measured either in Normal mode while TXD is HIGH, or in Sleep mode irrespective of the status of pin TXD.

A falling edge at pin WAKE_N followed by a LOW level maintained for a certain time period ($t_{\text{wake}(\text{dom})\text{WAKE_N}}$) results in a local wake-up. The pin WAKE_N provides an internal pull-up towards pin V_{BAT}. In order to prevent EMI issues, it is recommended to connect an unused pin WAKE_N to pin V_{BAT}.

After a local or remote wake-up, pin INH is activated (it goes HIGH) and the internal slave termination resistor is switched on. The wake-up request is indicated by a LOW active wake-up request signal on pin RXD to interrupt the microcontroller.

7.7 Wake-up via mode transition

It is also possible to set pin INH HIGH with a mode transition towards Normal mode via pin SLP_N. This is useful for applications with a continuously powered microcontroller.

7.8 Wake-up source recognition

The TJA1021 can distinguish between a local wake-up request on pin WAKE_N and a remote wake-up request via a dominant bus state. A local wake-up request sets the wake-up source flag. The wake-up source can be read on pin TXD in the Standby mode. If an external pull-up resistor on pin TXD to the power supply voltage of the microcontroller has been added, a HIGH level indicates a remote wake-up request (weak pull-down at pin TXD) and a LOW level indicates a local wake-up request (strong pull-down at pin TXD; much stronger than the external pull-up resistor).

The wake-up request flag (signalled on pin RXD) as well as the wake-up source flag (signalled on pin TXD) are reset immediately after the microcontroller sets pin SLP_N HIGH.

7.9 TXD dominant time-out function

A TXD dominant time-out timer circuit prevents the bus line from being driven to a permanent dominant state (blocking all network communication) if pin TXD is forced permanently LOW by a hardware and/or software application failure. The timer is triggered by a negative edge on pin TXD. If the duration of the LOW-level on pin TXD exceeds the internal timer value ($t_{\text{to}(\text{dom})\text{TXD}}$), the transmitter is disabled, driving the bus line into a recessive state. The timer is reset by a positive edge on pin TXD.

7.10 Fail-safe features

Pin TXD provides a pull-down to GND in order to force a predefined level on input pin TXD in case the pin TXD is unsupplied.

Pin SLP_N provides a pull-down to GND in order to force the transceiver into Sleep mode in case the pin SLP_N is unsupplied.

Pin RXD is set floating in case of lost power supply on pin V_{BAT} .

The current of the transmitter output stage is limited in order to protect the transmitter against short circuit to pins V_{BAT} or GND.

A loss of power (pins V_{BAT} and GND) has no impact on the bus line and the microcontroller. There are no reverse currents from the bus. The LIN transceiver can be disconnected from the power supply without influencing the LIN bus.

The output driver at pin LIN is protected against overtemperature conditions. If the junction temperature exceeds the shutdown junction temperature $T_{j(sd)}$, the thermal protection circuit disables the output driver. The driver is enabled again when the junction temperature has dropped below $T_{j(sd)}$ and a recessive level is present at pin TXD.

If V_{BAT} drops below $V_{th(VBATL)_L}$, a protection circuit disables the output driver. The driver is enabled again when $V_{BAT} > V_{th(VBATL)_H}$ and a recessive level is present at pin TXD.

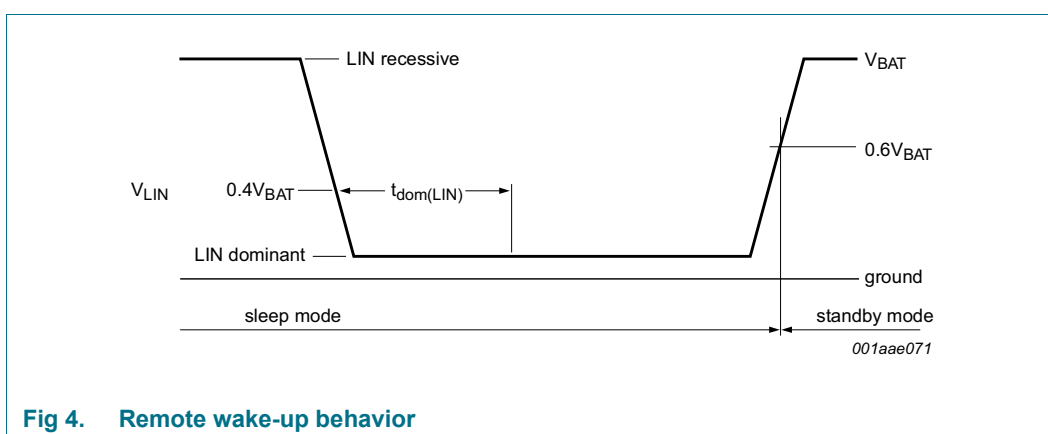

Fig 4. Remote wake-up behavior

8. Limiting values

Table 5. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134). All voltages are referenced to pin GND; unless otherwise specified. Positive currents flow into the IC.

Symbol	Parameter	Conditions	Min	Max	Unit
V _{BAT}	battery supply voltage	with respect to GND	-0.3	+40	V
V _{TXD}	voltage on pin TXD	I _{TXD} no limitation	-0.3	+6	V
		I _{TXD} < 500 μ A	-0.3	+7	V
V _{RXD}	voltage on pin RXD	I _{RXD} no limitation	-0.3	+6	V
		I _{RXD} < 500 μ A	-0.3	+7	V
V _{SLP_N}	voltage on pin SLP_N	I _{SLP_N} no limitation	-0.3	+6	V
		I _{SLP_N} < 500 μ A	-0.3	+7	V
V _{LIN}	voltage on pin LIN	with respect to GND, V _{BAT} and V _{WAKE_N}	-40	+40	V
V _{WAKE_N}	voltage on pin WAKE_N		-0.3	+40	V
I _{WAKE_N}	current on pin WAKE_N	only relevant if V _{WAKE_N} < V _{GND} - 0.3 current will flow into pin GND	-15	-	mA
V _{INH}	voltage on pin INH		-0.3	V _{BAT} +0.3	V
I _{O(INH)}	output current on pin INH		-50	+15	mA
V _{ESD}	electrostatic discharge voltage				
	according to IEC 61000-4-2	on pins WAKE_N, LIN and V _{BAT}	[1] -6	+6	kV
	human body model	on pins WAKE_N, LIN, V _{BAT} and INH	[2] -8	+8	kV
		on pins RXD, SLP_N and TXD	[2] -2	+2	kV
	charge device model	all pins	-750	+750	V
	machine model	all pins	[3] -200	+200	V
T _{vj}	virtual junction temperature		[4] -40	+150	°C
T _{stg}	storage temperature		-55	+150	°C

[1] Equivalent to discharging a 150 pF capacitor through a 330 Ω resistor; verified by an external test house.

[2] Equivalent to discharging a 100 pF capacitor through a 1.5 k Ω resistor.

[3] Equivalent to discharging a 200 pF capacitor through a 10 Ω resistor and a 0.75 μ H coil.

[4] Junction temperature in accordance with IEC 60747-1. An alternative definition is: $T_j = T_{amb} + P \times R_{th(j-a)}$, where $R_{th(j-a)}$ is a fixed value. The rating for T_{vj} limits the allowable combinations of power dissipation (P) and ambient temperature (T_{amb}).

9. Thermal characteristics

Table 6. Thermal characteristics

$t_{init(norm)}$	normal mode initialization time		5	-	20	μs
$t_{gotosleep}$	go to sleep time	time period for mode change from Normal slope mode into Sleep mode	2	5	10	μs
$t_{to(dom)TXD}$	TXD dominant time-out time	$V_{TXD} = 0 \text{ V}$	27	55	90	ms

[1] All parameters are guaranteed over the virtual junction temperature range by design. Factory testing uses correlated test conditions to cover the specified temperature and power supply voltage range.

[2] Not applicable for the /10 versions of the TJA1021.

[3] $\delta I, \delta 3 = \frac{t_{bus(rec)(min)}}{2 \times t_{bit}}$. Variable $t_{bus(rec)(min)}$ is illustrated in the LIN timing diagram in [Figure 6](#).

[4] Bus load conditions are: $C_{BUS} = 1 \text{ nF}$ and $R_{BUS} = 1 \text{ k}\Omega$; $C_{BUS} = 6.8 \text{ nF}$ and $R_{BUS} = 660 \text{ } \Omega$; $C_{BUS} = 10 \text{ nF}$ and $R_{BUS} = 500 \text{ } \Omega$.

[5] $\delta 2, \delta 4 = \frac{t_{bus(rec)(max)}}{2 \times t_{bit}}$. Variable $t_{bus(rec)(max)}$ is illustrated in the LIN timing diagram in [Figure 6](#).

[6] Load condition pin RXD: $C_{RXD} = 20 \text{ pF}$ and $R_{RXD} = 2.4 \text{ k}\Omega$.

[7] For $V_{BAT} > 18 \text{ V}$ the LIN transmitter might be suppressed. If TXD is HIGH then the LIN transmitter output is recessive.

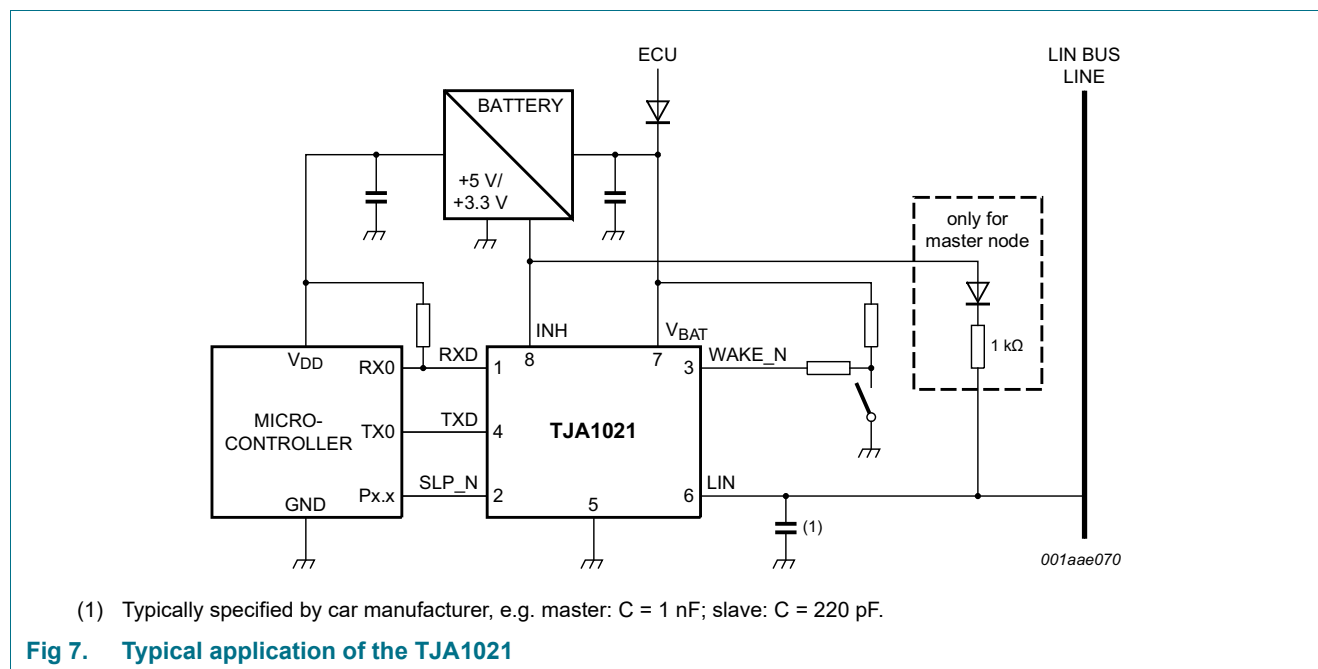

Fig 6. Timing diagram LIN transceiver

12. Application information

13. Test information

Immunity against automotive transients (malfunction and damage) in accordance with LIN EMC Test Specification / Version 1.0; August 1, 2004.

The waveforms of the applied transients are according to ISO 7637-2: Draft 2002-12, test pulses 1, 2a, 3a and 3b.

13.1 Quality information

This product has been qualified to the appropriate Automotive Electronics Council (AEC) standard Q100 or Q101 and is suitable for use in automotive applications.

14. Package outline

SO8: plastic small outline package; 8 leads; body width 3.9 mm

SOT96-1

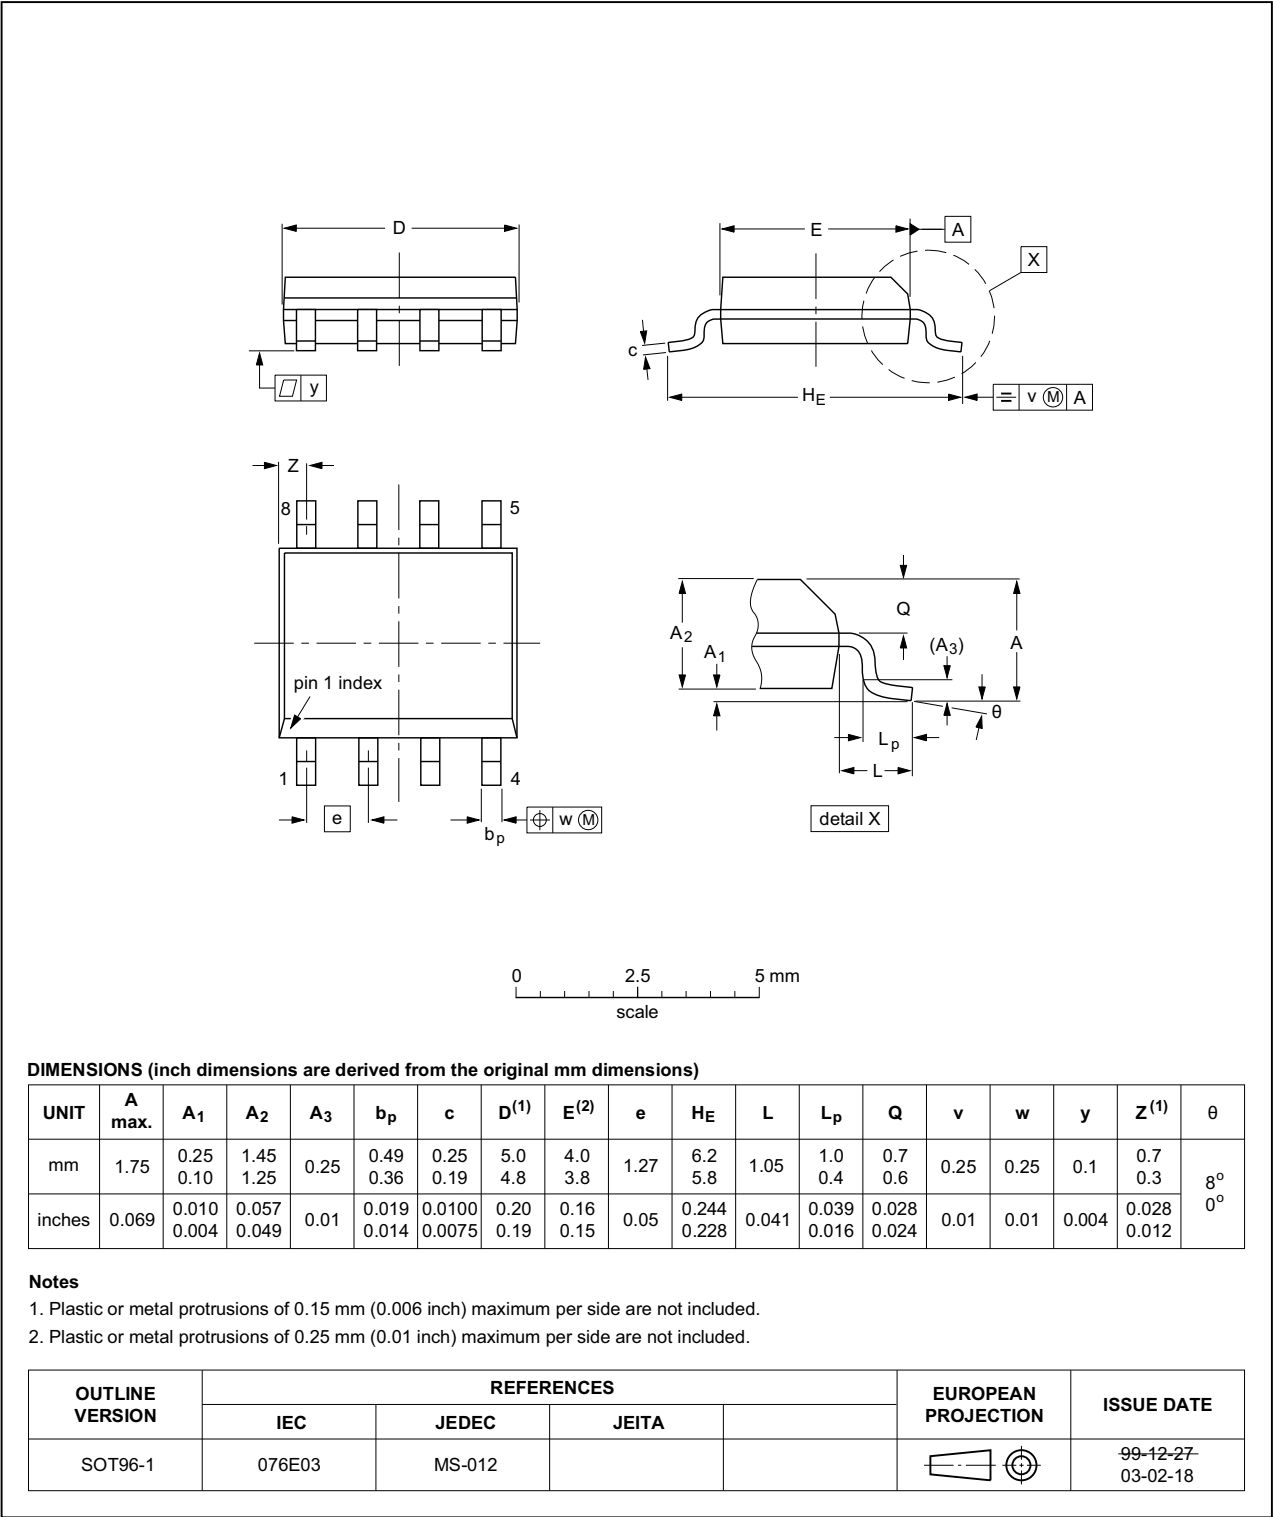

Fig 8. Package outline SOT96-1 (SO8)

HVSON8: plastic thermal enhanced very thin small outline package; no leads;
8 terminals; body 3 x 3 x 0.85 mm

SOT782-1

Fig 9. Package outline SOT782-1 (HVSON8)

15. Handling information

All input and output pins are protected against ElectroStatic Discharge (ESD) under normal handling. When handling ensure that the appropriate precautions are taken as described in *JESD625-A* or equivalent standards.

16. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

16.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

16.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

16.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

16.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 10](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 9](#) and [10](#)

Table 9. SnPb eutectic process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)	
	Volume (mm ³)	
	< 350	≥ 350
< 2.5	235	220
≥ 2.5	220	220

Table 10. Lead-free process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm ³)		
	< 350	350 to 2000	> 2000
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 10](#).

For further information on temperature profiles, refer to Application Note *AN10365* "Surface mount reflow soldering description".

17. Soldering of HVSON packages

[Section 16](#) contains a brief introduction to the techniques most commonly used to solder Surface Mounted Devices (SMD). A more detailed discussion on soldering HVSON leadless package ICs can found in the following application notes:

- *AN10365* "Surface mount reflow soldering description"
- *AN10366* "HVQFN application information"

19. Legal information

19.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

19.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

19.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use in automotive applications — This NXP Semiconductors product has been qualified for use in automotive applications. Unless otherwise agreed in writing, the product is not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.
