Electrical Characteristics

This chapter describes the electrical characteristics, switching characteristics, and I/O timing for Stratix® III devices. Electrical characteristics include operating conditions and power consumption. Switching characteristics include core performance specifications and periphery performance. A glossary is also included for your reference.

Operating Conditions

When Stratix III devices are implemented in a system, they are rated according to a set of defined parameters. To maintain the highest possible performance and reliability of Stratix III devices, system designers must consider the operating requirements described in this chapter.

Stratix III devices are offered in both commercial and industrial grades. Commercial devices are offered in –2 (fastest), –3, –4, and –4L speed grades. Industrial devices are offered only in –3, –4, and –4L speed grades.

In this chapter, a prefix associated with the operating temperature range is attached to the speed grades; commercial with a "C" prefix and industrial with an "I" prefix. For example, commercial devices are indicated as C2, C3, C4, and C4L per respective speed grades. Industrial devices are indicated as I3, I4, and I4L.

Absolute Maximum Ratings

Absolute maximum ratings define the maximum operating conditions for Stratix III devices. The values are based on experiments conducted with the device and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied at these conditions. Conditions beyond those listed in Table 1–1 may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods may have adverse effects on the device.

Table 1–1. Absolute Maximum Ratings for Stratix III Devices *(Note 1)* (Part 1 of 2)

Note to Table 1–1:

(1) Supply voltage specifications apply to voltage readings taken at the device pins, not the power supply.

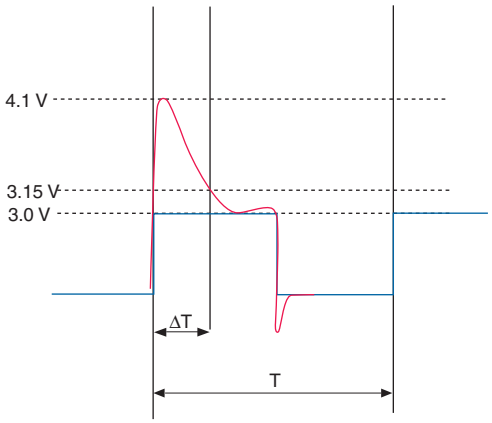
Sinusoidal Maximum Allowed Overshoot/Undershoot Voltage

During transitions, input signals may overshoot to the voltage listed in Table 1–2 and undershoot to –2.0 V for input currents less than 100 mA and periods shorter than 20 ns.

Table 1–2 lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage over the lifetime of the device. The maximum allowed overshoot duration is specified as percentage of high-time over the lifetime of the device.

A DC signal is equivalent to 100% duty cycle. For example, a signal that overshoots to 4.2 V can only be at 4.2 V for 15.8% over the lifetime of the device; for a device lifetime of 10 years, this is equivalent to 15.8% of ten years which is 18.96 months. Figure 1–1 shows how to determine the overshoot duration.

Figure 1–1. Overshoot Duration



In the example shown in Figure 1–1, the overshoot voltage is shown in red and is present at the Stratix III pin, up to 4.1 V. From Table 1–2, for an overshoot of up to 4.1 V, the percentage of high time for overshoot > 3.15 V can be as high as 46% over an 11.4-year period. The percentage of high time is calculated as (delta T/T) * 100. This 11.4-year period assumes the device is always turned on with 100% I/O toggle rate and 50% duty cycle signal. For lower I/O toggle rates and situations where the device is in an idle state, lifetimes are increased.

Table 1–2. Maximum Allowed Overshoot During Transitions

Symbol	Parameter	Condition	Overshoot Duration as a % of High Time	Unit

(2) For the EP3SL340, EP3SE260, and EP3SL200 devices in the I4L ordering code, the industrial junction temperature range is from 0° C to 100° C, regardless of supply voltage.

(3) Altera recommends a 3.0-V nominal battery voltage when connecting V_{CCBAT} to a battery for volatile key backup. If you do not use the volatile security key, you may connect the V_{CCBAT} to either GND or a 3.0-V power supply.

DC Characteristics

This section lists the input pin capacitances, on-chip termination tolerance, and hot- socketing specifications.

Supply Current

Standby current is the current the device draws after the device is configured with no inputs/outputs toggling and no activity in the device. Because these currents vary largely with the resources used, use the Excel-based Early Power Estimator (EPE) to get supply current estimates for your design.

Table 1–4 lists supply current specifications for V_{CC_CLKIN} and V_{CCPGM}. Use the EPE to get supply current estimates for the remaining power supplies.

Note to Table 1–15:

(1) Use the current strength settings that are equal or larger than the I_{OL} and I_{OH} values listed to meet the V_{OL} and V_{OH} specifications for each line. OCT or lower current strengths may provide better signal integrity and lower power.

Refer to the figures for "Differential I/O Standards" in "Glossary" on page 1–326 for the receiver input and transmitter output waveforms, and for all the differential I/O standards (LVDS, mini-LVDS, RSDS). V_{CC_CLKIN} is the power supply for the differential column clock input pins. V_{CCPD} is the power supply for the row I/Os and all other column I/Os.

Notes to Table 1–18:

(1) The minimum V_{ID} value is applicable over the entire common mode range, V_{CM}.

(2) RL range: $90 \leq RL \leq 110\ \Omega$.

(3) Column and row I/O banks support LVPECL I/O standards for input operation only on dedicated clock input pins. Differential clock inputs in column I/O use V_{CC_CLKIN} that must be powered by 2.5 V. Differential clock inputs in row I/O banks are powered by V_{CCPD}.

(4) The receiver voltage input range for the data rate when $D_{max} > 700$ Mbps is $0.85\ V \leq V_{IN} \leq 1.75\ V$.
The receiver voltage input range for the data rate when $D_{max} \leq 700$ Mbps is $0.45\ V \leq V_{IN} \leq 1.95\ V$.

(5) Power supply for the column I/O LVPECL differential clock input buffer is V_{CC_CLKIN}.

(6) The receiver voltage input range for the data rate when $D_{max} > 700$ Mbps is $1.0\ V \leq V_{IN} \leq 1.6\ V$.
The receiver voltage input range for the data rate when $D_{max} \leq 700$ Mbps is zero $V \leq V_{IN} \leq 1.85\ V$.

Power Consumption

Altera offers two ways to estimate power for a design: the Excel-based Early Power Estimator (EPE) and the Quartus® II **PowerPlay Power Analyzer** feature.

The interactive Excel-based Early Power Estimator is typically used prior to designing the FPGA in order to get a magnitude estimate of the device power. The Quartus II **PowerPlay Power Analyzer** provides estimation based on the specifics of the design after place-and-route is complete. The **PowerPlay Power Analyzer** can apply a combination of user-entered, simulation-derived, and estimated signal activities which, when combined with detailed circuit models, can yield very accurate power estimation.

Refer to Table 1–4 on page 1–5 for supply current estimates for V_{CCPGM} and V_{CC_CLKIN}. Use the EPE and PowerPlay Power Analyzer for current estimates of remaining power supplies.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide For Stratix III FPGAs* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

Switching Characteristics

This section provides performance characteristics of Stratix III core and periphery blocks for commercial grade devices.

These characteristics can be designated as **Preliminary** and **Final** and each designation is defined below.

Preliminary—Preliminary characteristics are created using simulation results, process data, and other known parameters.

Final—Final numbers are based on actual silicon characterization and testing. These numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions. The upper-right hand corner of a table shows the designation as **Preliminary** or **Final**.

Core Performance Specifications

These sections describe the Clock Tree, PLL, digital signal processing (DSP), TriMatrix, and Configuration and JTAG specifications.

Notes to Table 1–20:

(1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.

(2) This specification is limited by the lower of the two: I/O f_{max} or f_{out} of the PLL.

(3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source, which is less than 120 ps.

(4) F_{REF} is fIN/N when N = 1.

(5) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.99999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied.

(6) High bandwidth PLL settings are not supported in external feedback mode.

(7) The cascaded PLL specification is only applicable with the following conditions:
a) Upstream PLL: 0.59 MHz ≤ Upstream PLL BW < 1 MHz
b) Downstream PLL: Downstream PLL BW > 2 MHz

(8) External memory interface clock output jitter specifications use a different measurement method and are available in Table 1–33 on page 1–29.

Notes to Table 1–22:

(1) Use a memory block clock that comes through global clock routing from an on-chip PLL set to 50% output duty cycle to achieve the maximum memory block performance. Use the Quartus II software to report timing for this and other memory block clocking schemes.

(2) The F_{max} shown for M9K degrades 2% when you use the Error Detection CRC feature on the device, except for the C4L speed grade with V_{CCL} = 0.9 V. For the C4L speed grade with V_{CCL} = 0.9V, there is no degradation in F_{max} when you use the Error Detection CRC feature.

(3) The F_{max} shown for M144K degrades 10 MHz when you use byte-enable support on M144K.

(4) F_{max} is applicable when the **COMPTABILITY** option is turned ON.

(5) F_{max} is applicable when the **COMPTABILITY** option is turned OFF. This option is turned ON by default in Quartus II software.

(6) The F_{max} for the EP3SL200, EP3SE260, and EP3SL340 devices at the C2 speed grade is 7% slower than the C2 values shown in the table.

Configuration and JTAG Specifications

Table 1–23 lists the Stratix III configuration mode specifications.

Notes to Table 1–23:

(1) DCLK F_{max} is restricted when you enable the Remote Update feature. For more information, refer to the *Remote Update Circuitry (ALTREMOTE_UPDATE) Megafunction User Guide*.

(2) The data rate must be 4× slower than the clock when you use decompression and/or encryption.

(3) For more information about the minimum and typical DCLK F_{max} value in Fast Active Serial configuration, refer to the *Configuring Stratix III Devices* chapter.

Table 1–24 lists the JTAG timing parameters and values for Stratix III devices. Refer to the figure for "HIGH-SPEED I/O Block" in the "Glossary" on page 1–326 for the JTAG timing requirements.

Periphery Performance

This section describes periphery performance, including high-speed I/O and external memory interface.

I/O performance supports several system interfacing, such as the LVDS high-speed I/O interface, external memory interface, and the PCI/PCI-X bus interface. For example, Stratix III devices I/O configured with voltage referenced I/O standards can achieve up to the stated system interfacing speed as indicated in "External Memory Interface Specifications" on page 1–25. General-purpose I/O standards such as 3.3, 3.0, 2.5, 1.8, or 1.5 LVTTL/LVCMOS are capable of typical 167 MHz and 1.2 LVCMOS at 100MHz interfacing frequency with 10pF load.

Actual achievable frequency depends on design- and system-specific factors. You must perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

High-Speed I/O Specifications

Refer to the "Glossary" on page 1–326 for the definitions of the high-speed timing specifications.

Notes to Table 1–25:

(1) When J = 3 to 10, the SERDES block is used.

(2) When J = 1 or 2, the SERDES block is bypassed.

(3) Clock Boost Factor (W) is the ratio between the input data rate to the input clock rate.

(4) The minimum and maximum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) used. The I/O differential buffer and input register do not have a minimum toggle rate.

(5) The $t_{xJitter}$ specification is for the true LVDS I/O standard only.

(6) You can estimate the achievable maximum data rate for non-DPA mode by performing link timing closure analysis. Consider the board skew margin, transmitter delay margin, as well as the receiver sampling margin to determine the maximum data rate supported.

(7) This is achieved by using the LVDS and DPA clock network.

(8) If the receiver (with DPA enabled) and the transmitter are using shared PLLs, the minimum data rate is 150 Mbps.

(9) This is only applied to DPA and Soft-CDR modes.

Notes to Table 1–26:

(2) One data transition is defined as a 0-to-1 or 1-to-0 transition.

(3) The DPA lock time stated in this table applies to both commercial and industrial grade.

(4) These are the number of repetitions for the stated training pattern to achieve 256 data transitions.

(5) Altera recommends PLL re-calibration for the situations below to guarantee DPA locking:

- Sparse data transitions. For example: Repeating sequences of ten 1s and ten 0s.
- 0 PPM frequency difference and/or 0° phase difference between the clock and data.

(6) Slow clock = data rate (Hz)/ Deserialization factor.

C2	7	10	13	ps
C3, I3	7	11	15	ps
C4, I4	7	11.5	16	ps

Notes to Table 1–31:

(1) The valid settings for phase offset are -64 to +63 for frequency modes 0 to 3 and -32 to +31 for frequency modes 4 to 6.

(2) The typical value equals the average of the minimum and maximum values.

(3) The delay settings are linear with a cumulative delay variation of ± 20 ps for all speed grades. For example, when using a C2 speed grade and applying 10° phase offset settings to a 90° phase shift at 400 MHz, the expected minimum cumulative delay is [625 ps + (10*7 ps) - 20 ps] = 675 ps.

(2) The clock jitter specification applies to memory output clock pins generated using differential signal-splitter and DDIO circuits clocked by a PLL output routed on a regional or global clock network as specified. Altera recommends using the regional clock networks whenever possible.

I/O Timing

The following sections describe the timing models, preliminary and final timings, I/O timing measurement methodology, I/O default capacitive loading, programmable IOE delay, programmable output buffer delay, user I/O timing, and dedicated clock pin timing.

Timing Model

The DirectDrive technology and MultiTrack interconnect ensure predictable performance, accurate simulation, and accurate timing analysis across all Stratix III device densities and speed grades. This section describes the performance of the Stratix III device I/Os.

All specifications except the fast model are representative of worst-case supply voltage and junction temperature conditions. Fast model specifications are representative of best case process, supply voltage, and junction temperature conditions.

The timing numbers listed in this section are extracted from the Quartus II software version 8.1.

Preliminary and Final Timing

Timing models can have either preliminary or final status. The Quartus II software issues an informational message during design compilation if the timing models are preliminary. Table 1–36 lists the status of the Stratix III device timing models.

Preliminary status means that the timing models are subject to change in future Quartus II releases. Initially, timing numbers are created using simulation results, process data, and other known parameters. Parts of the timing models may be correlated to silicon measurements. Various tests are used to make the preliminary numbers as close to the actual timing parameters as possible.

Final timing models are based on simulation models that are characterized versus the actual device measurements under all allowable operating conditions. When the timing models are final, all or most of the Stratix III family devices have been completely characterized and no further changes to the timing model are expected.

I/O Timing Measurement Methodology

Altera characterizes timing delays at the worst-case process, minimum voltage, and maximum temperature for input register setup time (t_{su}) and hold time (t_h). The Quartus II software uses the following equations to calculate t_{su} and t_h timing for the Stratix III devices input signals.

t_{su} =

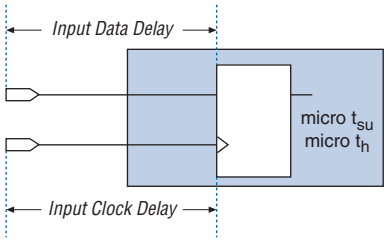
+ data delay from the input pin to the input register
+ micro setup time of the input register
- clock delay from the input pin to the input register

t_h =

- data delay from the input pin to the input register
+ micro hold time of the input register
+ clock delay from the input pin to the input register

Figure 1–4 shows the setup and hold timing diagram for input registers.

Figure 1–4. Input Register Setup and Hold Timing Diagram



For output timing, different I/O standards require different baseline loading techniques for reporting timing delays. Altera characterizes timing delays with the required termination for each I/O standard and with 0 pF (except for PCI and PCI-X, which use 10 pF) loading. The timing is specified up to the output pin of the FPGA device. The Quartus II software calculates I/O timing for each I/O standard with a default baseline loading as specified by the I/O standards.

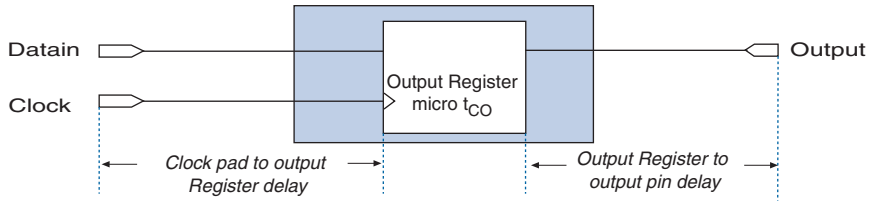
The following measurements are made during device characterization. Altera measures clock-to-output delays (t_{co}) at worst-case process, minimum voltage, and maximum temperature (PVT) for default loading conditions listed in Table 1–37 on page 1–34. The following equation describes clock-pin-to-output-pin timing for Stratix III devices.

The t_{co} from the clock pin to the I/O pin =

+ delay from the clock pad to the I/O output register
+ IOE output register clock-to-output delay
+ delay from the output register to the output pin

Figure 1–5 shows the output register clock to output timing diagram.

Figure 1–5. Output Register Clock to Output Timing Diagram



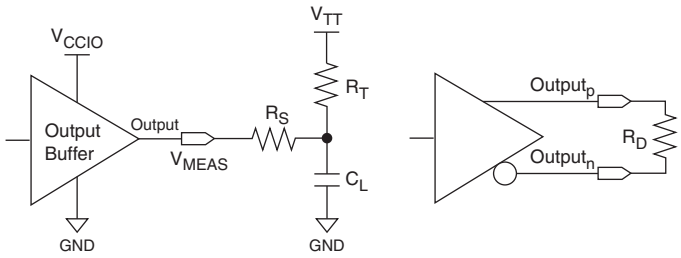
Simulation using IBIS models is required to determine the delays on the PCB traces in addition to the output pin delay timing reported by the Quartus II software and the timing model in the Stratix III Device Handbook. Perform the following steps:

1. Simulate the output driver of choice into the generalized test setup using values from Table 1–37.
2. Record the time to V_{MEAS} at the far end of the PCB trace.
3. Simulate the output driver of choice into the actual PCB trace and load using the appropriate IBIS model or capacitance value to represent the load.
4. Record the time to V_{MEAS} at the far end of the PCB trace.

5. Compare the results of steps 2 and 4. The increase or decrease in delay must be added to or subtracted from the I/O Standard Output Adder delays to yield the actual worst-case propagation delay (clock-to-output) of the PCB trace.

The Quartus II software reports the timing with the conditions listed in Table 1–37 using Equation 1–1 on page 1–7. Figure 1–6 shows the circuit that is represented by the output timing of the Quartus II software.

Figure 1–6. Output Delay Timing Report Setup for Single-Ended Outputs and Dedicated Differential Outputs *(Note 1)*



Note to Figure 1–6:

(1) Output pin timing is reported at the output pin of the FPGA device. Additional delays for loading and board trace delay must be accounted for with IBIS model simulations.

Figure 1–7 and Figure 1–8 show the circuit that is represented by the output timing of the Quartus II software for differential outputs with single and multiple external resistors, respectively.

Notes to Table 1–37:

(1) Hyper transport is not supported by Stratix III devices.
(2) LVPECL outputs are not supported by Stratix III devices.
(3) You can change the Quartus II timing conditions using the Advanced I/O Timing feature.
(4) V_{CC} is nominally 1.1 V less 50 mV (1.05 V).
(5) Terminated I/O standards require an additional 30 mV IR drop on V_{CC} (1.02 V).
(6) Terminated I/O standards require an additional 50 mV IR drop on V_{CCIO} and V_{CCPD}.

Programmable IOE Delay

Table 1–39 lists the Stratix III IOE programmable delay settings.

For more information about the annotation of delays in the IOE, refer to Figure 7–7 in the *Stratix III Device I/O Features* chapter.

Notes to Table 1–39:

(1) You can set the parameter values in the Quartus II software by selecting D1, D2, D3, D4, D5, and D6 in the Assignment Name column.

(2) The minimum offset represented in this table does not include the intrinsic delay.

Programmable Output Buffer Delay

Table 1–40 lists the delay chain settings that control the rising and falling edge delays of the output buffer. The default delay is 0 ps.

Table 1–40. Programmable Output Buffer Delay *(Note 1)*

Symbol	Parameter	Typical	Unit
D_{OUTBUF}	Rising and/or Falling Edge delay	0 (default)	ps
		50	ps
		100	ps
		150	ps

Note to Table 1–40:

(1) You can set the programmable output buffer delay in the Quartus II software by setting the **Output Buffer Delay Control** assignment to either positive, negative, or both edges with the specific values stated in this table for the **Output Buffer Delay** assignment.

User I/O Pin Timing

Table 1–41 through Table 1–140 list user I/O pin timing for Stratix III devices. I/O buffer t_{su}, t_h, and t_{co} are reported for the cases when the I/O clock is driven by a non-PLL global clock (GCLK) and the PLL is driven by the global clock (GCLK-PLL). For t_{su}, t_h, and t_{co} using the regional clock, add the value from the adder tables listed for each device to the GCLK/GCLK-PLL values for the device.

EP3SL50 I/O Timing Parameters

Table 1–41 through Table 1–44 list the maximum I/O timing parameters for EP3SL50 devices for single-ended I/O standards.

Table 1–41 lists the EP3SL50 column pins input timing parameters for single-ended I/O standards.

Table 1–49 and Table 1–50 list the EP3SL50 regional clock (RCLK) adder values that must be added to the GCLK values. Use these adder values to determine I/O timing when the I/O pin is driven using the regional clock. This applies to all I/O standards supported by Stratix III devices.

Table 1–49 lists the EP3SL50 column pin delay adders when using the regional clock.

Table 1–59 and Table 1–60 list the EP3SL70 regional clock (RCLK) adder values that must be added to the GCLK values. Use these adder values to determine I/O timing when the I/O pin is driven using the regional clock. This applies to all I/O standards supported by Stratix III devices.

Table 1–59 lists the EP3SL70 column pin delay adders when using the regional clock.

Table 1–69 and Table 1–70 list the EP3SL110 regional clock (RCLK) adder values that must be added to the GCLK values. Use these adder values to determine I/O timing when the I/O pin is driven using the regional clock. This applies to all I/O standards supported by Stratix III devices.

Table 1–69 lists the EP3SL110 column pin delay adders when using the regional clock.

Table 1–79 and Table 1–80 list the EP3SL150 regional clock (RCLK) adder values that must be added to the GCLK values. Use these adder values to determine I/O timing when the I/O pin is driven using the regional clock. This applies to all I/O standards supported by Stratix III devices.

Table 1–79 lists the EP3SL150 column pin delay adders when using the regional clock.

Table 1–99 and Table 1–100 list the EP3SL340 regional (RCLK) clock adder values that must be added to the GCLK values. Use these adder values to determine I/O timing when the I/O pin is driven using the regional clock. This applies to all I/O standards supported by Stratix III devices.

Table 1–99 lists the EP3SL340 column pin delay adders when using the regional clock.

Table 1–109 and Table 1–110 list the EP3SE50 regional clock (RCLK) adder values that must be added to the GCLK values. Use these adder values to determine I/O timing when the I/O pin is driven using the regional clock. This applies to all I/O standards supported by Stratix III devices.

Table 1–109 lists the EP3SE50 column pin delay adders when using the regional clock in Stratix III devices.

Table 1–119 and Table 1–120 list the EP3SE80 regional clock (RCLK) adder values that must be added to the GCLK values. Use these adder values to determine I/O timing when the I/O pin is driven using the regional clock. This applies to all I/O standards supported by Stratix III devices.

Table 1–119 lists the EP3SE80 column pin delay adders when using the regional clock.

Table 1–129 and Table 1–130 list the EP3SE110 regional clock (RCLK) adder values that must be added to the GCLK values. Use these adder values to determine I/O timing when the I/O pin is driven using the regional clock. This applies to all I/O standards supported by Stratix III devices.

Table 1–129 lists the EP3SE110 column pin delay adders when using the regional clock.

Glossary Table (Part 3 of 4)

Letter	Subject	Definitions
S	SW (sampling window)	The period of time during which the data must be valid in order to capture it correctly. The setup and hold times determine the ideal strobe position within the sampling window (the following figure): Timing Diagram 	Single-ended Voltage Referenced I/O Standard	The JEDEC standard for SSTI and HSTL I/O standards defines both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state. The new logic state is maintained as long as the input stays beyond the DC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing (The following figure): Single-Ended Voltage Referenced I/O Standard T	t_C	High-Speed receiver/transmitter input and output clock period.
	TCCS (channel-to-channel-skew)	The timing difference between the fastest and slowest output edges, including t_{co} variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the *Timing Diagram* figure under **S** in this table)
	t_{DUTY}	High-Speed I/O Block: Duty cycle on high-speed transmitter output clock. Timing Unit Interval (TUI) The timing budget allowed for skew, propagation delays, and data sampling window. (TUI = 1/(Receiver Input Clock Frequency Multiplication Factor) = t_C/w)
	t_{FALL}	Signal high-to-low transition time (80-20%)
	t_{INCCJ}	Cycle-to-cycle jitter tolerance on PLL clock input
	t_{OUTPJ_IO}	Period jitter on general purpose I/O driven by a PLL
	t_{OUTPJ_DC}	Period jitter on dedicated clock output driven by a PLL
	t_{RISE}	Signal low-to-high transition time (20-80%)
