The values in this table correspond to the nominal creepage and clearance values as detailed in "12.Package Outline: 16-Pin Wide Body SOIC" on page 25, "10.Package Outline: 8-Pin Narrow Body SOIC" on page 23. VDE certifies the clearance and creepage limits as 8.5 mm minimum for the WB SOIC-16 package and 4.7 mm minimum for the NB SOIC-8 package. UL does not impose a clearance and creepage minimum for component level certifications. CSA certifies the clearance and creepage limits as 3.9 mm minimum for the NB SOIC-8 and 7.6 mm minimum for the WB SOIC-16 package. 2. To determine resistance and capacitance, the Si822x is converted into a 2-terminal device. Pins 1–8 (1–4, NB SOIC-8) are shorted together to form the first terminal and pins 9–16 (5–8, NB SOIC-8) are shorted together to form the second terminal. The parameters are then measured between these two terminals. 3. Measured from input pin to ground.

4. Functional Description

4.1. Theory of Operation

The Si8220/21 is a functional upgrade for popular opto-isolated drivers, such as the Avago HPCL-3120, HPCL-0302, Toshiba TLP350, and others. The operation of an Si8220/21 channel is analogous to that of an opto coupler, except an RF carrier is modulated instead of light. This simple architecture provides a robust isolated data path and requires no special considerations or initialization at start-up. A simplified block diagram for the Si8220/21 is shown in Figure 6.

Figure 6. Simplified Channel Diagram

A channel consists of an RF Transmitter and RF Receiver separated by a semiconductor-based isolation barrier. Referring to the Transmitter, input A modulates the carrier provided by an RF oscillator using on/off keying. The Receiver contains a demodulator that decodes the input state according to its RF energy content and applies the result to output B via the output driver. This RF on/off keying scheme is superior to pulse code schemes as it provides best-in-class noise immunity, low power consumption, and better immunity to magnetic fields. See Figure 7 for more details.

5. Technical Description

5.1. Device Behavior

Truth tables for the Si8220/21 are summarized in Table 9.

Table 9. Si8220/21 Truth Table Summary

Cathode	Anode	Diode Current (I_F)	V_{DD}	V_O	Comments
X	X	X	$< UVLO$	L	Device turned off
Hi-Z	X	0	$> UVLO$	L	Logic low state
X	Hi-Z	0	$> UVLO$	L	Logic low state
GND	GND	0	$> UVLO$	L	Logic low state
VF	VF	0	$> UVLO$	L	Logic low state
GND1	VF	$< I_{F(OFF)}$	$> UVLO$	L	Logic low state
GND1	VF	$\geq I_{F(OFF)}$	$> UVLO$	H	Logic high state

Note: "X" = don't care. This truth table assumes V_{DD} is powered. If V_{DD} is below $UVLO$, see "5.3.Under Voltage Lockout (UVLO)" on page 15 for more information.

5.2. Device Startup

Output V_O is held low during power-up until V_{DD} rises above the $UVLO+$ threshold for a minimum time period of t_{START} . Following this, the output is high when the current flowing from anode to cathode is $> I_{F(ON)}$. Device startup, normal operation, and shutdown behavior is shown in Figure 8.

Figure 8. Si8220/21 Operating Behavior ($I_F \geq I_{F(MIN)}$ when $V_F \geq V_{F(MIN)}$)

5.3. Under Voltage Lockout (UVLO)

The UVLO circuit unconditionally drives V_O low when V_{DD} is below the lockout threshold. Referring to Figures 9 through 12, upon power up, the Si8220/21 is maintained in UVLO until V_{DD} rises above V_{DDUV+} . During power down, the Si8220/21 enters UVLO when V_{DD} falls below the UVLO threshold plus hysteresis (i.e., $V_{DD} \leq V_{DDUV+} - V_{DDHYS}$).

6. Applications

6.1. Power Supply Connections

V_{SS} can be biased at, above, or below ground as long as the voltage on V_{DD} with respect to V_{SS} is a maximum of 24 V. V_{DD} decoupling capacitors should be placed as close to the package pins as possible. The optimum values for these capacitors depend on load current and the distance between the chip and its power source. It is recommended that 0.1 and 10 μ F bypass capacitors be used to reduce high-frequency noise and maximize performance.

6.2. Layout Considerations

It is most important to minimize ringing in the drive path and noise on the V_{DD} lines. Care must be taken to minimize parasitic inductance in these paths by locating the Si8220/21 as close to the device it is driving as possible. In addition, the V_{DD} supply and ground trace paths must be kept short. For this reason, the use of power and ground planes is highly recommended. A split ground plane system having separate ground and V_{DD} planes for power devices and small signal components provides the best overall noise performance.

6.3. Power Dissipation Considerations

Proper system design must assure that the Si8220/21 operates within safe thermal limits across the entire load range. The Si8220/21 total power dissipation is the sum of the power dissipated by bias supply current, internal switching losses, and power delivered to the load, as shown in Equation 1.

$$P_D = (V_F)(I_F)(\text{Duty Cycle}) + (V_{DD})(I_{QOUT}) + (C_{int})(V_{DD}^2)(F) + (C_L)(V_{DD}^2)(F)$$

where:

P_D is the total Si8220 device power dissipation (W)

I_F is the diode current (20 mA max)

V_F is the diode anode voltage (2.8 V max)

I_{QOUT} is the driver maximum bias current (5 mA)

C_{int} is the internal parasitic capacitance (370 pF)

V_{DD} is the driver-side supply voltage (24 V max)

F is the switching frequency (Hz)

Equation 1.

The maximum allowable power dissipation for the Si8220/21 is a function of the package thermal resistance, ambient temperature, and maximum allowable junction temperature, as shown in Equation 2.

$$P_{Dmax} \leq \frac{T_{jmax} - T_A}{\theta_{ja}}$$

where:

P_{Dmax} is the maximum allowable Si8220/21 power dissipation (W)

T_{jmax} is the Si8220/21 maximum junction temperature (150 °C)

T_A is the ambient temperature (°C)

θ_{ja} is the Si8220/21 package junction-to-air thermal resistance (125 °C/W)

Equation 2.

Substituting values for P_{Dmax} , T_{jmax} , T_A , and θ_{ja} into Equation 2 results in a maximum allowable total power dissipation of 1.0 W. The maximum allowable load is found by substituting this limit and the appropriate datasheet values from Table 1 on page 4 into Equation 1 and simplifying. The result is Equation 3, where $V_F = 2.8$ V, $I_F = 10$ mA, and $V_{DD} = 18$ V.

$$C_{L(max)} = \frac{1.35 \times 10^{-3}}{F} - 1.85 \times 10^{-10}$$

where:

$C_{L(max)}$ is the maximum load (pF) allowable at switching frequency F

Equation 3.

A graph of Equation 3 is shown in Figure 13. Each point along the load line in this graph represents the package dissipation-limited value of C_L for the corresponding switching frequency.

Figure 13. Maximum Load vs. Switching Frequency

6.4. Input Circuit Design

Opto driver manufacturers typically recommend the circuits shown in Figures 14 and 15. These circuits are specifically designed to improve opto-coupler input common-mode rejection and increase noise immunity.

Figure 14. Opto Driver Input Circuit

Figure 15. High CMR Opto Driver Input Circuit

The optically-coupled driver circuit of Figure 14 turns the LED on when the control input is high. However, internal capacitive coupling from the LED to the power and ground conductors can momentarily force the LED into its off state when the anode and cathode inputs are subjected to a high common-mode transient. The circuit shown in Figure 15 addresses this issue by using a value of $R1$ sufficiently low to overdrive the LED, ensuring it remains on during an input common-mode transient. $Q1$ shorts the LED off in the low output state, again increasing common-mode transient immunity. Some opto driver applications also recommend reverse-biasing the LED when the control input is off to prevent coupled noise from energizing the LED.

The Si8220/21 can be used with the input circuits shown in Figures 14 and 15; however, some applications will require increasing the value of $R1$ in order to limit I_F to a maximum of 20 mA. The Si8220/21 propagation delay and output drive do not change for values of I_F between $I_{F(MIN)}$ and $I_{F(MAX)}$. New designs should consider the input circuit configurations of Figure 16, which are more efficient than those of Figures 14 and 15. As shown, $S1$ represents any suitable switch, such as a BJT or MOSFET, analog transmission gate, processor I/O, etc. Also, note that the Si8220/21 input can be driven from the I/O port of any MCU or FPGA capable of sourcing a minimum of 5 mA (see Figure 16C).

Figure 16. Si8220/21 Other Input Circuit Configurations

6.5. Parametric Differences between Si8220/21 and HCPL-0302 and HCPL-3120 Opto Drivers

The Si8220/21 is designed to directly replace HCPL-3120 and similar opto drivers. Parametric differences are summarized in Table 10 below.

Table 10. Parametric Differences of Si8220 vs. HCPL-3120

Parameter	Si8220	HCPL-3120	Units
Max supply voltage	24	30	V
ON state forward input current	5 to 20	7 to 16	mA
OFF state input voltage	−0.6 to +1.6	−0.3 to +0.8	V
Max reverse input voltage	0.5	−5	V
UVLO threshold (rising)	5.8 to 13.8	11.0 to 13.5	V
UVLO threshold (falling)	5.5 to 12.8	9.7 to 12.0	V
UVLO hysteresis	0.28 to 1	1.6	V
Rise/fall time into 10 Ω in series with 10 nF	20	100	ns

Table 11. Parametric Differences of Si8221 vs. HCPL-0302

Parameter	Si8221	HCPL-0302	Units
Max supply voltage	24	30	V
ON state forward input current	5 to 20	7 to 16	mA
OFF state input voltage	−0.6 to +1.6	−0.3 to +0.8	V
Max reverse input voltage	0.5	−5	V
UVLO threshold (rising)	5.8 to 13.8	11.0 to 13.5	V
UVLO threshold (falling)	5.5 to 12.8	9.7 to 12.0	V
UVLO hysteresis	0.28 to 1	1.6	V
Rise/fall time into 10 Ω in series with 10 nF	20	100	ns

6.5.1. Supply Voltage and UVLO

The supply voltage of the Si8220/21 is limited to 24 V, and the UVLO voltage thresholds are scaled accordingly. Opto replacement applications should limit their supply voltages to 24 V or less.

6.5.2. Input Diode Differences

The Si8220/21 input circuit requires less current and has twice the off-state noise margin compared to opto drivers. However, high CMR opto driver designs that overdrive the LED (see Figure 15) may require increasing the value of R1 to limit input current to 20 mA max. In addition, there is no benefit in driving the Si8220/21 input diode into reverse bias when in the off state. Consequently, opto driver circuits using this technique should either leave the negative bias circuitry unpopulated or modify the circuitry (e.g. add a clamp diode) to ensure that the anode pin of the Si8220/21 is no more than −0.8 V with respect to the cathode when reverse-biased.

9,16	V_{SS}	External MOSFET source connection and ground reference for V_{DD} . This terminal is typically connected to ground but may be tied to a negative or positive voltage.
13	V_O	Output signal.
15	V_{DD}	Output-side power supply input referenced to V_{SS} (24 V max).
*Note: No Connect. These pins are not internally connected.

DOCUMENT CHANGE LIST

Revision 0.22 to Revision 1.0

- Updated Tables 2, 3, 4, and 5.
- Updated "9. Ordering Guide" .
- Added Device Marking sections.

Revision 1.0 to Revision 1.1

- Updated Table 5 on page 10.
- Updated Table 8 on page 12.
- Removed introductory text and Figure 17.
- Changed all packages to MSL2A in "9.Ordering Guide" on page 22.
- Updated "12.Package Outline: 16-Pin Wide Body SOIC" on page 25.

Revision 1.1 to Revision 1.2

- Updated CMTI spec in Table 1 on page 4.
- Updated Figure 1 on page 6.
- Updated Figure 2 on page 6.
- Added Figure 3 on page 7.
- Updated Table 5 on page 10.
- Added note to Table 14 on page 22.

Revision 1.2 to Revision 1.3

- Added references to AEC-Q100 throughout.
- Changed all 60747-5-2 references to 60747-5-5.
- Added references to CQC throughout.
- Removed all references to moisture sensitivity level.

Revision 1.3 to Revision 1.4

- Updated Table 14, Ordering Part Numbers.
 - Added Revision D Ordering Part Numbers.
 - Removed all Ordering Part Numbers of previous revisions.

Revision 1.4 to Revision 1.5

- Updated Table 2 on page 8.
 - Added CQC certificate numbers.
- Updated Table 3 on page 9.
 - Updated Erosion Depth specification.
- Updated Table 8 on page 12.
 - Replaced I_O with Peak Output Current I_{OPK} .
 - Added T_J specification in Table 8 on page 12.
- Updated Figure 14 on page 17.
- Updated Figure 15 on page 18.
- Updated Figure 16 on page 18.
- Updated "9.Ordering Guide" on page 22.
 - Updated AEC-Q100 note.
