

IMPORTANT INFORMATION/DISCLAIMER

All product specifications, statements, information and data (collectively, the "Information") in this datasheet or made available on the website are subject to change. The customer is responsible for checking and verifying the extent to which the Information contained in this publication is applicable to an order at the time the order is placed. All Information given herein is believed to be accurate and reliable, but it is presented without guarantee, warranty, or responsibility of any kind, expressed or implied.

Statements of suitability for certain applications are based on KYOCERA AVX's knowledge of typical operating conditions for such applications, but are not intended to constitute and KYOCERA AVX specifically disclaims any warranty concerning suitability for a specific customer application or use.

ANY USE OF PRODUCT OUTSIDE OF SPECIFICATIONS OR ANY STORAGE OR INSTALLATION INCONSISTENT WITH PRODUCT GUIDANCE VOIDS ANY WARRANTY.

The Information is intended for use only by customers who have the requisite experience and capability to determine the correct products for their application. Any technical advice inferred from this Information or otherwise provided by KYOCERA AVX with reference to the use of KYOCERA AVX's products is given without regard, and KYOCERA AVX assumes no obligation or liability for the advice given or results obtained.

Although KYOCERA AVX designs and manufactures its products to the most stringent quality and safety standards, given the current state of the art, isolated component failures may still occur. Accordingly, customer applications which require a high degree of reliability or safety should employ suitable designs or other safeguards (such as installation of protective circuitry or redundancies) in order to ensure that the failure of an electrical component does not result in a risk of personal injury or property damage.

Unless specifically agreed to in writing, KYOCERA AVX has not tested or certified its products, services or deliverables for use in high risk applications including medical life support, medical device, direct physical patient contact, water treatment, nuclear facilities, weapon systems, mass and air transportation control, flammable environments, or any other potentially life critical uses. Customer understands and agrees that KYOCERA AVX makes no assurances that the products, services or deliverables are suitable for any highrisk uses. Under no circumstances does KYOCERA AVX warrant or quarantee suitability for any customer design or manufacturing process.

Although all product-related warnings, cautions and notes must be observed, the customer should not assume that all safety measures are indicted or that other measures may not be required.

Accu-Guard®

Introduction

ACCU-GUARD® TECHNOLOGY

The Accu-Guard® series of fuses is based on thin-film techniques. This technology provides a level of control on the component electrical and physical characteristics that is generally not possible with standard fuse technologies. This has allowed KYOCERA AVX to offer a series of devices which are designed for modern surface mount circuit boards which require protection.

FEATURES

- Accurate current rating
- Fast acting
- Small-standard 0402, 0603, 0805, 1206 and 0612 chip sizes
- Taped and reeled
- Completely compatible with all soldering systems used for SMT
- Lead Free Series (F0402G, F0603G, F0402E, F0603E, F0805B, F1206B)

APPLICATIONS

- · Two-Way Radios
- Home Appliances
- Battery Management Systems
- **Battery Chargers**
- Rechargeable Battery Packs
- Computers
- Hard Disk Drives
- PDA's
- LCD Screens
- SCSI Interface
- **Digital Cameras**
- Video Cameras

For RoHS compliant products, please select correct termination style.

Accu-Guard® II Low Current

The new F0402G and F0603G Accu-Guard® series of fuses is based on thin-film technology which allows precise control of the component electrical and physical characteristics that is not possible with standard fuse technologies. The Accu-Guard Low Current series encompasses the lowest current ratings in compact 0402 and 0603 packages and features LGA terminations.

ELECTRICAL SPECIFICATIONS

Operating temperature: -55°C to +125°C Current carrying capacity:

> -55°C to -11°C 107% of rating -10°C to +60°C 100% of rating +61°C to +100°C 85% of rating +101°C to +125°C 80% of rating

Rated voltage: 63V (F0603G), 32V (F0402G)

Post-fusing resistance: $>1M\Omega$

Interrupt rating: 50A

ENVIRONMENTAL CHARACTERISTICS

Test	Conditions	Required
Solderability	Components completely immersed in a solder bath at 245 ±5°C for 3 secs.	Total area of imperfections in solder coatup to 5% of the land suface area
Leach Resistance	Components completely immersed in a solder bath at 255 ±5°C for 60 secs.	Dissolution of termination ≤ 15% of the land surface area
Storage	12 months minimum with components stored in "as received" packaging.	Good solderability
Shear	Components mounted to a substrate. Increasing shearing force applied paralled to the sufstrate till destruction.	Destruction at 5N force minimum
Temperature Cycling	Components mounted to a flexible substrate (e.g. FR – 4). 1000 cycles -55°C to +125°C.	No Visible damage ΔR/R<10%
Bend	Tested as shown in diagram 3 mm Deflection 45mm 45mm	No visible damage ΔR/R<10%

Accu-Guard® II

SMD Thin-Film Fuse

Accu-Guard® II is a version of Accu-Guard® fuses for a wider range of current and voltage ratings. Constructed on alumina substrates, Accu-Guard® II fuses display superior electrical, mechanical and environmental properties. Accu-Guard® II dimensions are standard 0402, 0603, 0805, 1206 and 0612 chip sizes, see page 2.

ELECTRICAL SPECIFICATIONS

Operating temperature: -55°C to +125°C

Current carrying capacity:

For F0402E and F0603E at -55°C 107% of rating, at +25°C 100% of rating, at +125°C 80% of rating. For F0603C at -55°C is 107% of rating, at +25°C 100% of rating, at +85°C 90% of rating, at +125°C 75% of rating

For F1206B and F0805B at -55°C is 107% of rating, at +25°C 100% of rating, at +85°C 93% of rating, at +125°C 90% of rating. For F0805B 2.50A and 3.00A at +85°C 90% of rating, at +125°C 90% of rating.

Interrupting rating: 50A.

Insulation resistance: $>20M\Omega$ guaranteed (after fusing at rated voltage).

For F0612D at -55°C 107% of rating, at +25°C 100% of rating, at +85°C 80% of rating, at +125°C 75% of rating.

^{*} Current is limited to less than 50A at 32V due to internal fuse resistance

ENVIRONMENTAL CHARACTERISTICS

Test	Conditions	Requirement
Solderability	Components completely immersed in a solder bath at 235 ±5°C for 2 secs.	Terminations to be well tinned No visible damage
Leach Resistance	Leach Resistance Completely immersed in a solder bath at 260 ±5°C for 60 secs.	
Storage	12 months minimum with components stored in "as received" packaging.	Good solderability
Shear	Components mounted to a substrate. A force of 5N applied normal to the line joining the terminations and in a line parallel to the substrate.	No visible damage
Rapid Change of Temperature	Components mounted to a substrate. 5 cycles -55°C to +125°C.	No visible damage Δ R/R<10%
Vibration	Per Mil-Std-202F Vibration Method 201A and Method 204D Condition D.	
Load Life	25°C, I rated, 20,000 hrs.	No visible damage ΔR/R<10%

Accu-Guard®

SMD Thin-Film Fuse Handling and Soldering

QUALITY & RELIABILITY

Accu-Guard® series of fuses is based on established thin-film technology and materials used in the semiconductor industry.

- •In-line Process Control: This program forms an integral part of the production cycle and acts as a feedback system to regulate and control production processes. The test procedures, which are integrated into the production process, were developed after long research and are based on the highly developed semiconductor industry test procedures and equipment. These measures help KYOCERA AVX/Kyocera to produce a consistent and high yield line of products.
- · Final Quality Inspection: Finished parts are tested for standard elecrical parameters and visual/mechanical characteristics. Each production lot is 100% evaluated for electrical resistance. In addition, each production lot is evaluated on sample basis for:
- Insulation resistance (post fusing)
- · Blow time for two times rated current
- Endurance Test: 125°C, rated current, 4 hours

HANDLING AND SOLDERING

SMD chips should be handled with care to avoid damage or contamination from perspiration and skin oils. The use of plastic tipped tweezers or vacuum pick-ups is strongly recommended for individual components. Bulk handling should ensure that abrasion and mechanical shock are minimized. For automatic equipment, taped and reeled product is the ideal medium for direct presentation to the placement machine.

CIRCUIT BROAD TYPE

All flexible types of circuit boards may be used (e.g. FR-4, G-10).

For other circuit board materials, please consult factory.

WAVE SOLDERING

Dimensions: millimeters (inches)

COMPONENT PAD DESIGN

Component pads must be designed to achieve good joints and minimize component movement during soldering. Pad designs are given below for both wave and reflow soldering.

The basis of these designs are:

- a. Pad width equal to component width. It is permissible to decrease this to as low as 85% of component width but it is not advisable to go below this
- b. Pad overlap 0.5mm.
- c. Pad extension 0.5mm for reflow. Pad extension about 1.0mm for wave soldering.

PREHEAT & SOLDERING

The rate of preheat in production should not exceed 4°C/second. It is recommended not to exceed 2°C/second Temperature differential from preheat to soldering should not exceed 150°C. For further specific application or process advice, please consult KYOCERA AVX

HAND SOLDERING & REWORK

Hand soldering is permissible. Preheat of the PCB to 100°C is required. The most preferable technique is to use hot air soldering tools. Where a soldering iron is used, a temperature controlled model not exceeding 30 watts should be used and set to not more than 260°C. Maximum allowed time at temperature is 1 minute

COOLING

After soldering, the assembly should preferably be allowed to cool naturally. In the event of assisted cooling, similar conditions to those recommended for preheating should be used

REFLOW SOLDERING

Dimensions: millimeters (inches)

RECOMMENDED SOLDERING PROFILES

RECOMMENDED REFLOW **SOLDERING PROFILE COMPONENTS WITH SnPb TERMINATIONS**

RECOMMENDED REFLOW SOLDERING PROFILE LEAD FREE COMPONENTS WITH Sn100 TERMINATIONS

CLEANING RECOMMENDATIONS

Care should be taken to ensure that the devices are thoroughly cleaned of flux residues, especially the space beneath the device. Such residues may otherwise become conductive and effectively offer a lousy bypass to the device. Verious recommended cleaning conditions (which must be optimized for the flux system being used) are as follows:

Cleaning liquids......i-propanol, ethanol, acetylacetone, water, and other standard PCB cleaning liquids.

Ultrasonic conditions...power - 20w/liter max.

frequency - 20kHz to 45kHz

Temperature...... 80°C maximum (if not otherwise limited by

chosen solvent system).

TIME.....5 minutes max.

STORAGE CONDITIONS

Recommended storage conditions for Accu-Guard® prior to use are as follows:

Temperature: 15°C to 35°C

Humidity: ≤65%

Air Pressure: 860mbar to1060mbar

Accu-Guard®

PACKAGING

Automatic Insertion Packaging

Tape & Reel: All tape and reel specifications are in compliance with EIA 481-1

- 8mm carrier
- Reeled quantities: Reels of 3,000 or 10,000 pieces (for F0402: 5,000 or 20,000 pieces)

REEL DIMENSIONS

Note: The nominal dimensions of the component compartment (W,L) are derived from the component size.

Accu-Guard®

HOW TO CHOOSE THE CORRECT ACCU-GUARD FUSE FOR CIRCUIT PROTECTION

Correct choice of an Accu-Guard® fuse for a given application is fairly straightforward. The factor of pre-arc I2t, however, requires clarification. The proper design for pre-arc I2t is presented by way of example

DESIGN PARAMETERS

1. Operating Temperature

The Accu-Guard® is specified for operation in the temperature range of -55°C to +125°C. Note, however, that fusing current is sensitive to temperature this means that the fuse must be derated or uprated at circuit temperatures other than 25°C:

Environmental Temperature	Accu-Guard® Current Carrying Capacity*						
	F0402G F0603G F0402E, F0603E	F0805B, F1206A, F1206B	F0805B 2.50A & 3.00A	F0603C	F0612D		
-55°C to -11°C	1.07 x I _R	1.07 x I _R	1.07 x I _R	1.07 x I _R	1.07 x I _R		
-10°C to 60°C	I _R	I _R	I _R	I _R	I _R		
61°C to 100°C	0.85 x I _R	0.93 x I _R	0.90 x I _R	0.90 x I _R	0.80 x I _R		
101°C to 125°C	0.80 x I _R	0.90 x I _R	0.90 x I _R	0.75 x I _R	0.75 x I _R		

^{*}As a function of nominal rated current, I_D.

2. Circuit Voltage

Maximum Voltage: Accu-Guard® is specified for circuits of up to rated voltage. Accu-Guard® will successfully break currents at higher voltages as well, but over voltage may crack the fuse body.

Minimum Voltage: Accu-Guard® cannot be used in circuits with voltage of about 0.5V and less. The internal resistance of the fuse will limit the fault current to a value which will prevent reliable actuation of the fuse (<2 x rated current).

3. Maximum Fault Current

Accu-Guard® is fully tested and specified for fault currents up to 50A. Accu-Guard® will successfully break currents above 50A, but such current may crack the fuse body or damage the fuse terminations.

4. Steady-State Current

Accu-Guard® is specified to operate at least 4 hours at rated current without fusing (25°C). Engineering tests have shown that F0805B and F1206A/B Accu-Guard® will in fact operate at least 20,000 hours at rated current without fusing (25°C).

5. Switch-on and Other Pulse Current

Many circuits generate a large current pulse when initially connected to power. There are also circuits which are subject to momentary current pulses due to external sources; telephone line cords which are subject to lightninginduced pulses are one example. These current pulses must be passed by the fuse without causing actuation. These pulses may be so large that they are the determining factor for choosing the Accu-Guard® current rating; not necessarily steady state current.

In order to design for current pulses, the concept of fuse pre-arc Joule integral, I²t, must be understood. Fuse current rating is defined by the requirement that 2 x Ir or 2.5 x Ir (depending on fuse type) will cause actuation in t<5 seconds. This rating does not indicate how the fuse will react to very high currents of very short duration. Rather, the fusing characteristic at very high currents is specified by I2t-t curves (or I2t-I).

I2t expresses the amount of energy required to actuate the fuse. Total I2t expresses the total energy which will be passed by the fuse until total cessation of current flow. Pre-arc I2t expresses that energy required to cause large irreversible damage to the fuse element (Total I^2t = pre-arc I^2t + arc I^2t). If the Joule integral of the switch-on pulse is larger than the fuse pre-arc I2t, nuisance actuation will occur.

In order to choose the proper Accu-Guard® current rating for a given application, it is necessary to calculate the I2t Joule integral of the circuit switch-on and other current pulses and compare them to the Accu-Guard® I2t-t curves. An Accu-Guard® fuse must be chosen such that the pulse I2t is no more than 50% of the pre-arc I2t of the prospective fuse.

Pre-arc I2t of the Accu-Guard® fuses is well characterized; I2t-t and I2t-I graphs are in this catalog. The problem is calculating the I2t of the circuit current pulses. This concept is not familiar to most engineers. Correct calculation of pulse Joule integral and subsequent choice of Accu-Guard® current rating is illustrated by way of the attached examples.

Fuse Selection Guide

DESIGNING FOR CURRENT PULSE SITUATIONS

1. Sine wave current pulse

The Joule integral for sine wave pulse is $[(I_{max})^2 \times t]/2$

see Fig. 1a.

Fig. 1a. Sine wave pulse paramerters for Joule integral calculation, example #1.

Thus, for the current pulse in Flgure 1b, the Joule integral is $[(4.8A)^2 \times 7.7 \times 10^{-6} \text{ sec}]/2 = 8.9 \times 10^{-5} A^2 \text{ sec}$

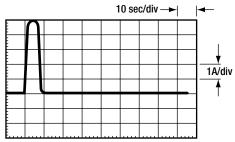

Fig. 1b. Triangular pulse, example #1.

The pulse duration is 7.7µsec. We must find a fuse that can absorb at least 8.9 x 10^{-5} x 2 = 1.8 x 10^{-4} A²sec Joule integral within 7.7 μ sec without actuation. According to the I²t graph on page 6, pre-arching Joule intergral is 2.3x10⁻⁴ A²sec for the 0.5A fuse, which is slightly more than needed. The next lower rating (0.375A), has only 6x10⁻⁵ A² sec, which is not enough. Therefore, 0.5A fuse should be chosen for this application, see Figure 1c.

FUSE PRE-ARCING JOULE INTEGRALS vs. PRE-ARCING TIME

Fig. 1c. Choice of 0.5A fuse, example #1.

- Pre-arcing I2t

-- Maximum l2t deisgn rule

x |12t for sample current pulse

2. Triangular current pulse

The Joule integral for triangular pulse is $[(I_{max})^2 \times t]/3$, see Fig. 2a.

Fig. 2a. Triangular pulse parameters for joule integral calculation, example #2.

Thus, for the current pulse in Figure 2b, the Joule integral is $[(1.5A^2 \times 3 \times 10^{-3} \text{ sec}]/3 = 2.25 \times 10^{-3} \text{ A}^2\text{sec}]$

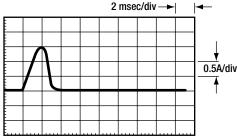

Fig. 2b. Triangular pulse, example #2.

The pulse duration is 3 msec. In the l2t graph on page 6, pre-arcing Joule intergral for 3 msec pulse is 4 x 10⁻³A²sec for the 0.5A fuse (not enough) and 2 x 10⁻² for the 0.75A fuse (more than enough). Therefore, 0.75A fuse should be chosen for this application, see Figure 2c.

FUSE PRE-ARCING JOULE INTEGRALS vs. PRE-ARCING TIME

Fig. 2c. Choice of 0.75A fuse, example #2.

--- Pre-arcing I2t

-- Maximum l2t deisgn rule

x |12t for sample current pulse

Fuse Selection Guide

DESIGNING FOR CURRENT PULSE SITUATIONS (CONT.)

3. Trapezoidal current pulse

The Joule integral for a trapezoidal pulse is

$$[(I_{max}^2 + I_{min}^2 + I_{max} * I_{min}) / 3] x t$$

see Fig. 3a.

Fig. 3a. Trapezoidal pulse paramerters for Joule integral calculation, example #3

Thus, for current pulse in Figure 3b, the Joule integral is: $\{[(0.56A)^2 + (1A)^2 + 0.56A \times 1^3A] / 3\} \times 3 \times 10^3 \text{s} = 1.9 \times 10^3 \text{A}^2 \text{sec}$

Fig. 3b. Trapezoidal pulse, example #3

According to the I2t graph on page 6, the 0.5A fuse should be chosen for this application, see Figure 3c.

FUSE PRE-ARCING JOULE INTEGRALS vs. PRE-ARCING TIME

Fig. 3c. Choice of 0.75A fuse, example #3. ---- Pre-arcing I2t

--- Maximum l²t deisgn rule

x I2t for sample current pulse

4. Lightning strike

A Lightning strike pulse is shown in Figure 4a. After an initial linear rise, the current declines exponentially

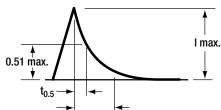

Fig. 4a. Lightning pulse parameters for Joule integral calculation, example #4

Joule integral for the linear current rise is calculated as for a triangular pulse, see example #2

The Joule integral for the exponential decline is

 $I_{\rm max}^2$ x $I_{0.5}$ x (-1/2ln 0.5) = 0.72($I_{\rm max}$)² x $I_{0.5}$ Thus, for the sample lightning strike pulse in Figure 4b, the total Joule integral is:

 $(25A)^2$ x 2 x 10^{-6} sec/3+0.72 x $(25A)^2$ x 10 x 10^{-6} sec = 4.92 x 10^{-3} A²sec

Fig. 4b. Lightning strike pulse, example #4.

For practical calculations, the duration of exponential decline may be assumed to be 3t_{0.5}, because within this time 98.5% of the pulse energy is released. Thus, the total pulse duration in this example is 30 µsec, and the 1.25A fuse should be chosen for this application, see Figure 4c.

FUSE PRE-ARCING JOULE INTEGRALS vs. PRE-ARCING TIME

Fig. 4c. Choice of 0.5A fuse, example #4.

--- Pre-arcing I2t

--- Maximum l2t deisgn rule

x |12t for sample current pulse

Fuse Selection Guide

DESIGNING FOR CURRENT PULSE SITUATIONS (CONT.)

5. Complex current pulse

If the pulse consists of several waveforms, all of them should be evaluated seperately, and then the total Joule integral should be calculated as well.

Fig. 5a. Complex pulse, example #5

In Figure 5a, the Joule integral for the first triangle is [(4.67A)² x 294 x 10⁻⁶sec]/3=2.14 x 10⁻³ A²sec and 0.75A fuse should meet this condition, see Figure 5b.

FUSE PRE-ARCING JOULE INTEGRALS vs. PRE-ARCING TIME

Fig.5b. Choice of fuse, example #5

- ---- Pre-arcing I2t
- --- Maximum l2t deisgn rule
 - x |12t for sample switch-on pulse

The Joule integral for the second triangle is $[(5.33A)^2 \times 269 \times 10^{-6} \text{sec}]/3 = 2.55 \times 10^{-3} \text{ A}^2 \text{sec}$, and 0.75A fuse is suitable for this case also, see Figure 5b.

However, for the whole pulse, the Joule integral is 4.7 x 10⁻³ A²sec, and the total duration is 563 µsec. For the 0.75A fuse, the Joule integral is only 8.6 x 10⁻³ A²sec for this pulse duration, so 1A fuse should be chosen for this application, see Figure 5b.

6. Switch-on pulse and steady-state current

In Figure 6a, the switch-on pulse is a triangle pulse with a 5.1 x 10⁻³ A²sec Joule integral of 5 msec duration; the 0.75A fuse will meet this requirement, see Figure 6b.

Fig. 6a. Switch-on pulse and steady-state current, example #6

FUSE PRE-ARCING JOULE INTEGRALS vs. PRE-ARCING TIME

Fig. 6b. Choice of 0.75A fuse, example #6.

- ---- Pre-arcing l²t
- --- Maximum l2t deisgn rule
 - x I2t for sample current pulse

The steady-state current is 0.5A, and 1A fuse is typically recommended to meet the steady-state condition. Based on steady-state current, the 1A fuse should be chosen for this application.
