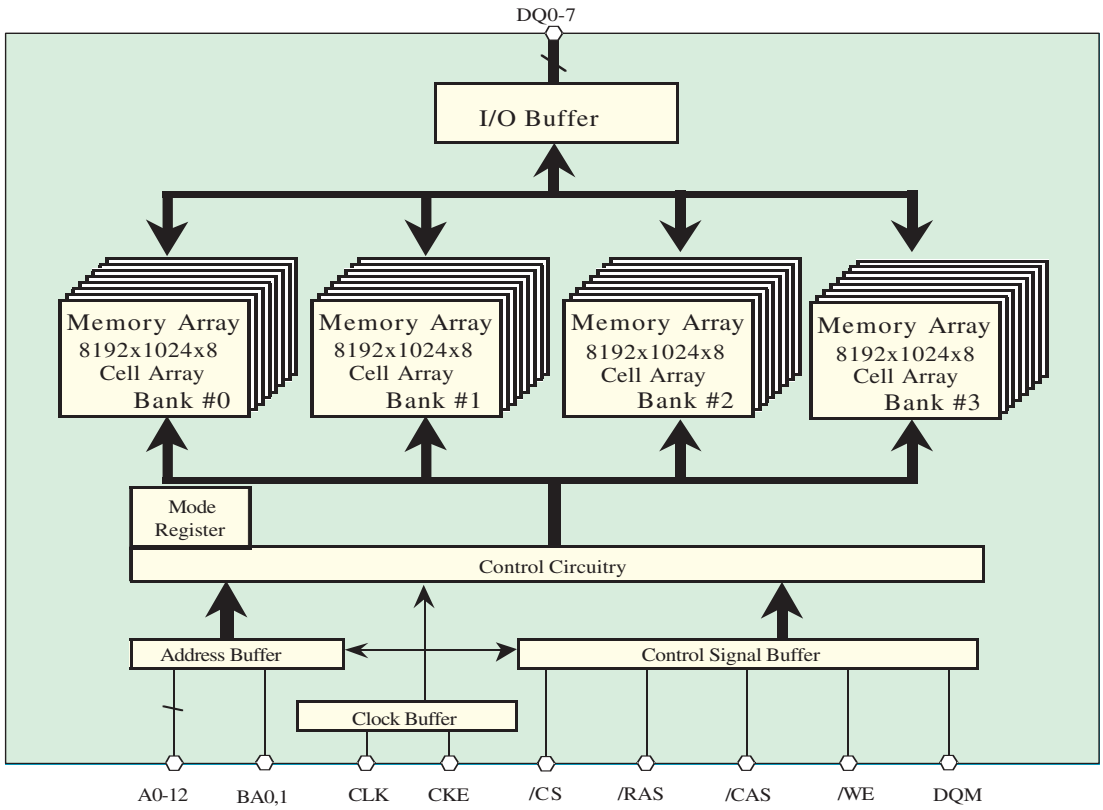
BLOCK DIAGRAM



Note:This figure shows the IS42S83200A
The IS42S16160A configuration is 8192x512x16 of cell array and DQ0-15

PIN FUNCTION

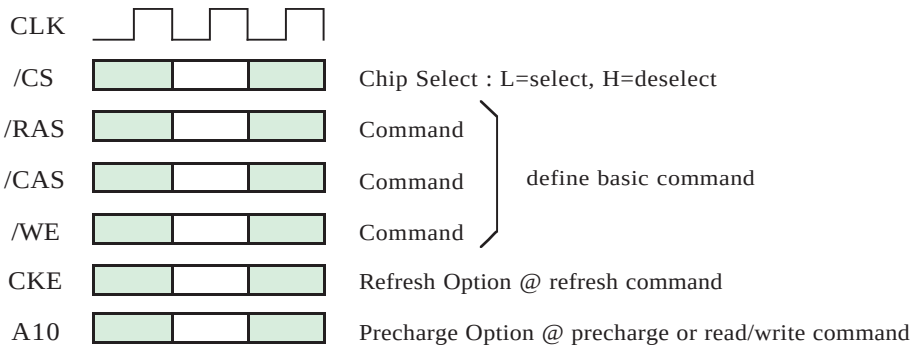
CLK	Input	Master Clock: All other inputs are referenced to the rising edge of CLK
CKE	Input	Clock Enable: CKE controls internal clock.When CKE is low, internal clock for the following cycle is ceased. CKE is also used to select auto / self-refresh. After self-refresh mode is started, CKE becomes asynchronous input. Self-refresh is maintained as long as CKE is low.
/CS	Input	Chip Select: When /CS is high, any command means No Operation.
/RAS, /CAS, /WE	Input	Combination of /RAS, /CAS, /WE defines basic commands.
A0-12	Input	A0-12 specify the Row / Column Address in conjunction with BA0,1. The Row Address is specified by A0-12. The Column Address is specified by A0-9(x8)/A0-8(x16). A10 is also used to indicate precharge option. When A10 is high at a read / write command, an auto precharge is performed. When A10 is high at a precharge command, all banks are precharged.
BA0,1	Input	Bank Address: BA0,1 specifies one of four banks to which a command is applied. BA0,1 must be set with ACT, PRE , READ , WRITE commands.
DQ0-7(x8), DQ0-15(x16)	Input / Output	Data In and Data out are referenced to the rising edge of CLK.
DQM(x8), DQMU/L(x16)	Input	Din Mask / Output Disable: When DQM(U/L) is high in burst write, Din for the current cycle is masked. When DQM(U/L) is high in burst read, Dout is disabled at the next but one cycle.
Vdd, Vss	Power Supply	Power Supply for the memory array and peripheral circuitry.
VddQ, VssQ	Power Supply	VddQ and VssQ are supplied to the Output Buffers only.

BASIC FUNCTIONS

The IS42S83200A/16160A provides basic functions, bank (row) activate, burst read / write, bank (row) precharge, and auto / self refresh.

Each command is defined by control signals of /RAS, /CAS and /WE at CLK rising edge. In addition to 3 signals, /CS, CKE and A10 are used as chip select, refresh opt ion, and precharge option, respectively .

To know the detailed definition of commands, please see the command truth table.



Activate (ACT) [/RAS =L, /CAS =/WE =H]

ACT command activates a row in an idle bank indicated by BA.

Read (READ) [/RAS =H, /CAS =L, /WE =H]

READ command starts burst read from the active bank indicated by BA. First output data appears after /CAS latency. When A10 =H at this command, the bank is deactivated after the burst read (auto-precharge, **READA**).

Write (WRITE) [/RAS =H, /CAS =/WE =L]

WRITE command starts burst write to the active bank indicated by BA. Total data length to be written is set by burst length. When A10 =H at this command, the bank is deactivated after the burst write (auto-precharge, **WRITEA**).

Precharge (PRE) [/RAS =L, /CAS =H, /WE =L]

PRE command deactivates the active bank indicated by BA. This command also terminates burst read / write operation. When A10 =H at this command, all banks are deactivated (precharge all, **PREA**).

Auto-Refresh (REFA) [/RAS =/CAS =L, /WE =CKE =H]

REFA command starts auto-refresh cycle. Refresh address including bank address are generated internally. After this command, the banks are precharged automatically.

ABBREVIATIONS:

H=High Level, L=Low Level, X=Don't Care

BA=Bank Address, RA=Row Address, CA=Column Address, NOP=No OPeration

NOTES:

1. All entries assume that CKE was High during the preceding clock cycle and the current clock cycle.
2. ILLEGAL to bank in specified state; function may be legal in the bank indicated by BA, depending on the state of that bank.
3. Must satisfy bus contention, bus turn around, write recovery requirements.
4. NOP to bank precharging or in idle state. May precharge bank indicated by BA.
5. ILLEGAL if any bank is not idle.

ILLEGAL = Device operation and/or data-integrity are not guaranteed.

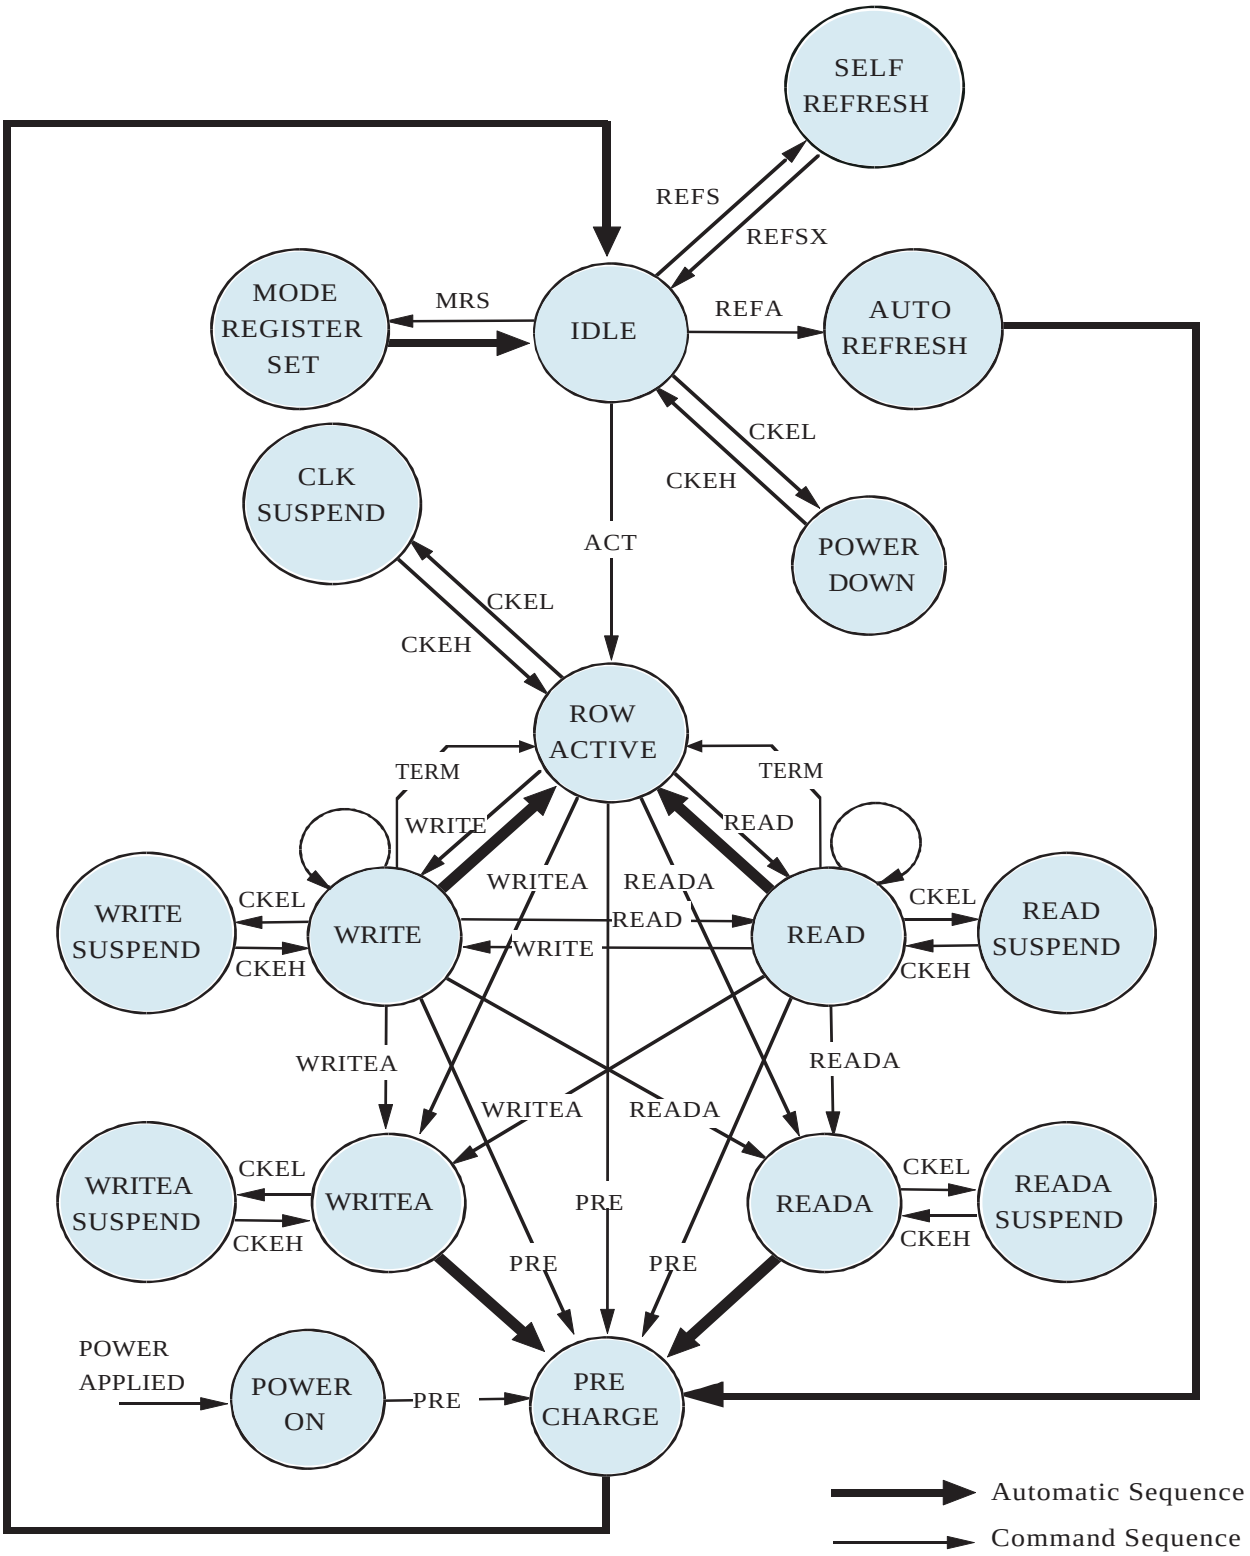
ABBREVIATIONS:

H=High Level, L=Low Level, X=Don't Care

NOTES:

1. CKE Low to High transition will re-enable CLK and other inputs **asynchronously**. A minimum setup time must be satisfied before any command other than EXIT.
2. Self-Refresh can be entered only from the All Banks Idle State.
3. Must be legal command.

SIMPLIFIED STATE DIAGRAM



POWER ON SEQUENCE

Before starting normal operation, the following power on sequence is necessary to prevent a SDRAM from damaged or malfunctioning.

1. Apply power and start clock. Attempt to maintain CKE high, DQM high and NOP condition at the inputs.
2. Maintain stable power, stable clock, and NOP input conditions for a minimum of 200µs.
3. Issue precharge commands for all banks. (PRE or PREA)
4. After all banks become idle state (after tRP), issue 8 or more auto-refresh commands.
5. Issue a mode register set command to initialize the mode register.

After these sequence, the SDRAM is idle state and ready for normal operation.

MODE REGISTER

Burst Length, Burst Type and /CAS Latency can be programmed by setting the mode register (MRS). The mode register stores these data until the next MRS command, which may be issued when all banks are in idle state. After tRSC from a MRS command, the SDRAM is ready for new command.

OPERATIONAL DESCRIPTION

BANK ACTIVATE

The SDRAM has four independent banks. Each bank is activated by the ACT command with the bank addresses (BA0,1). A row is indicated by the row addresses A0-12. The minimum activation interval between one bank and the other bank is tRRD.Multiple banks can be active state concurrently by issuing multiple ACT commands.

PRECHARGE

The PRE command deactivates the bank indicated by BA0,1. When multiple banks are active, the precharge all command (PREA, PRE + A10=H) is available to deactivate them at the same time.

After tRP from the precharge, an ACT command to the same bank can be issued.BA0-1 are **"DON'T CARE"** in this case.

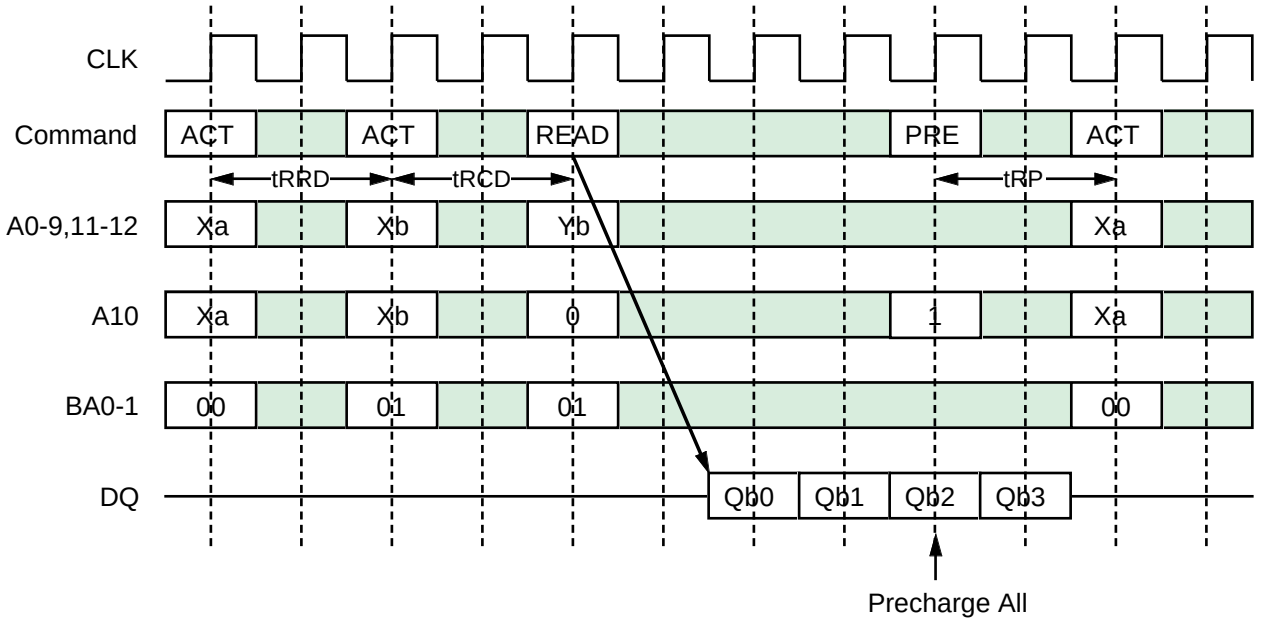
READ

After tRCD from the bank activation, a READ command can be issued. 1st output data is available after the /CAS Latency from the READ, followed by (BL -1) consecutive data when the Burst Length is BL. The start address is specified by A0-9(X8), A0-8(X16) , and the address sequence of burst data is defined by the Burst Type.

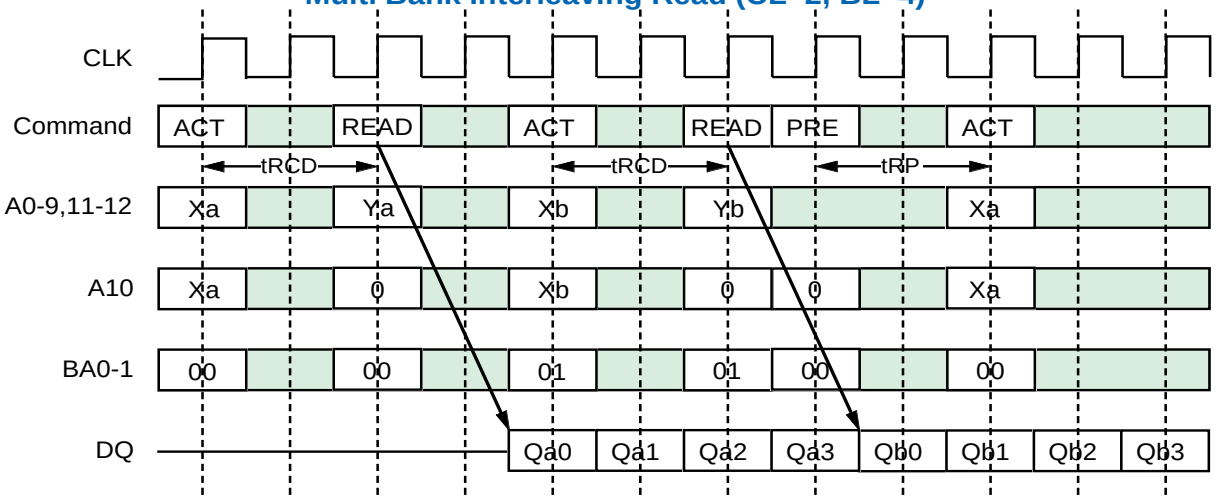
A READ command may be applied to any active bank, so the row precharge time (tRP) can be hidden behind continuous output data by interleaving the multiple banks. When A10 is high at a READ command, the auto-precharge (READA) is performed. Any command (READ, WRITE, PRE, TBST, ACT) to the same bank is inhibited till the internal precharge is complete. The internal precharge starts at BL after READA. The next ACT command can be issued after (BL + tRP) from the previous READA.

In any case, tRCD+BL≥ tRASmin must be met.

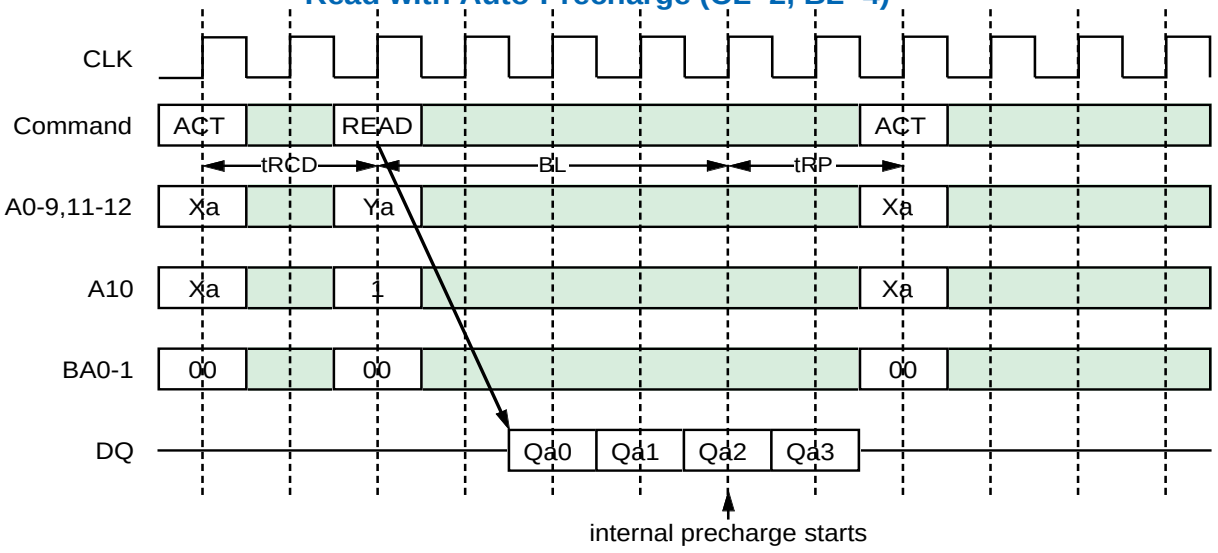
Bank Activation and Precharge All (BL=4, CL=3)



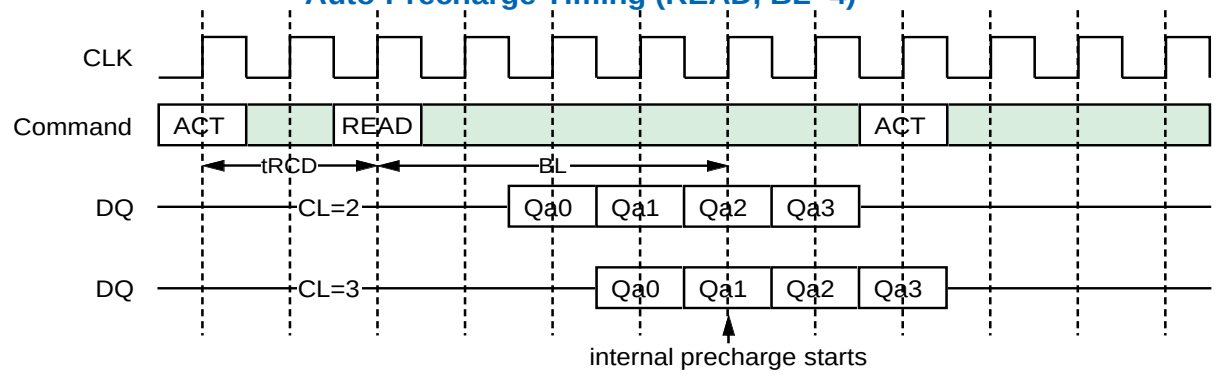
Multi Bank Interleaving Read (CL=2, BL=4)



Read with Auto-Precharge (CL=2, BL=4)



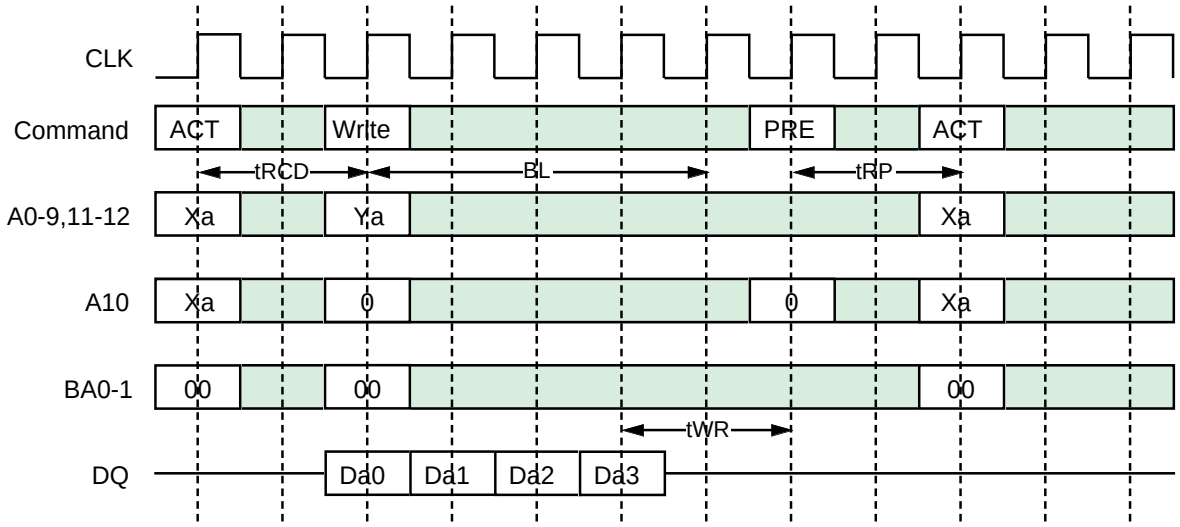
Auto-Precharge Timing (READ, BL=4)



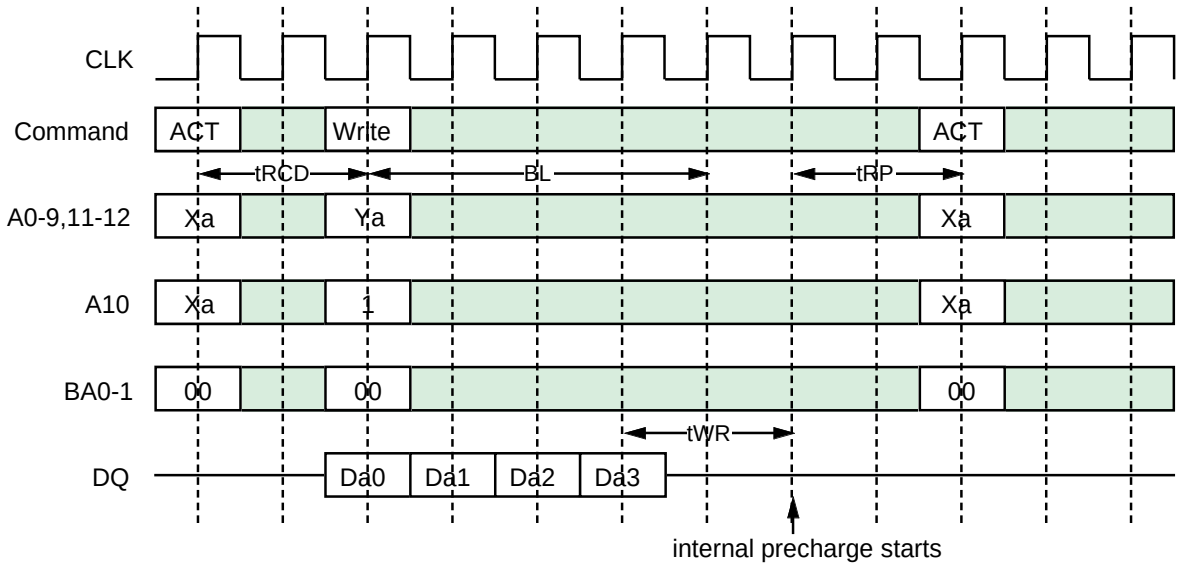
WRITE

A WRITE command can be issued to any active bank. The start address is specified by A0-9(x8), A0-8(x16). 1st input data is set at the same cycle as the WRITE. The consecutive data length to be write is defined by the Burst Length. The address sequence of burst data is defined by Burst Type. Minmum delay time of a WRITE command after an ACT command to the same bank is tRCD. From the last input data to the PRE command , the write recovery time (tWR) is required. When A10 is high at a WRITE command , auto-precharge (WRITEA) is performed. Any command (READ,WRITE,PRE,ACT,TBST) to the same bank is inhibited till the internal precharge is complete. The internal precharge starts at tWR after the last input data cycle . The next ACT command can be issued after (BL+tWR-1+tRP) from the previous WRITEA. In any case, tRCD+BL+tWR-1≥ tRASmin must be met.

Write (BL=4)



Write with Auto-Precharge (BL=4)

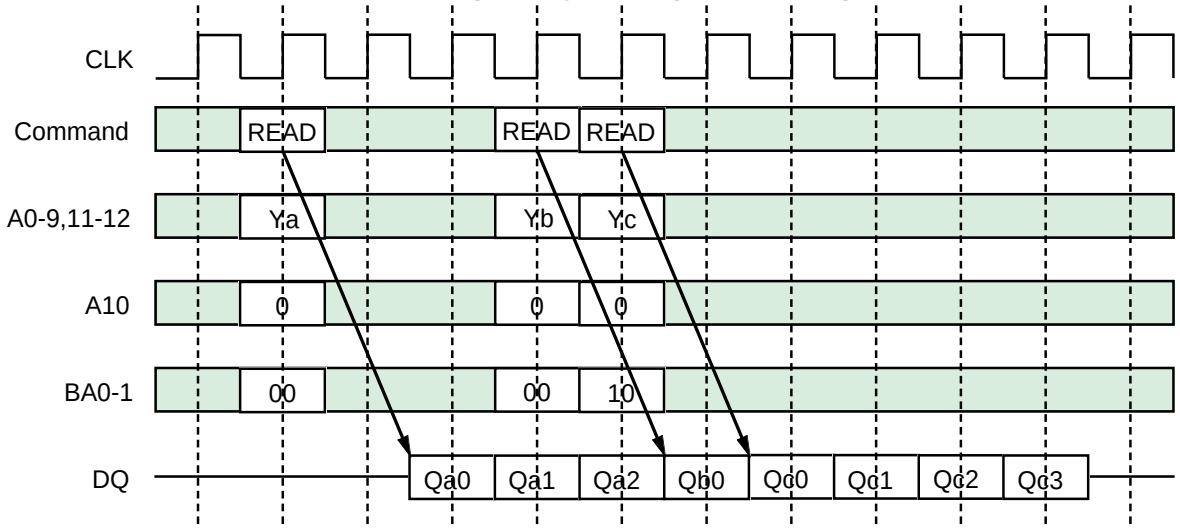


BURST INTERRUPTION

[Read Interrupted by Read]

Burst read operation can be interrupted by new read of any bank. Random column access is allowed READ to READ interval is minimum 1 CLK..

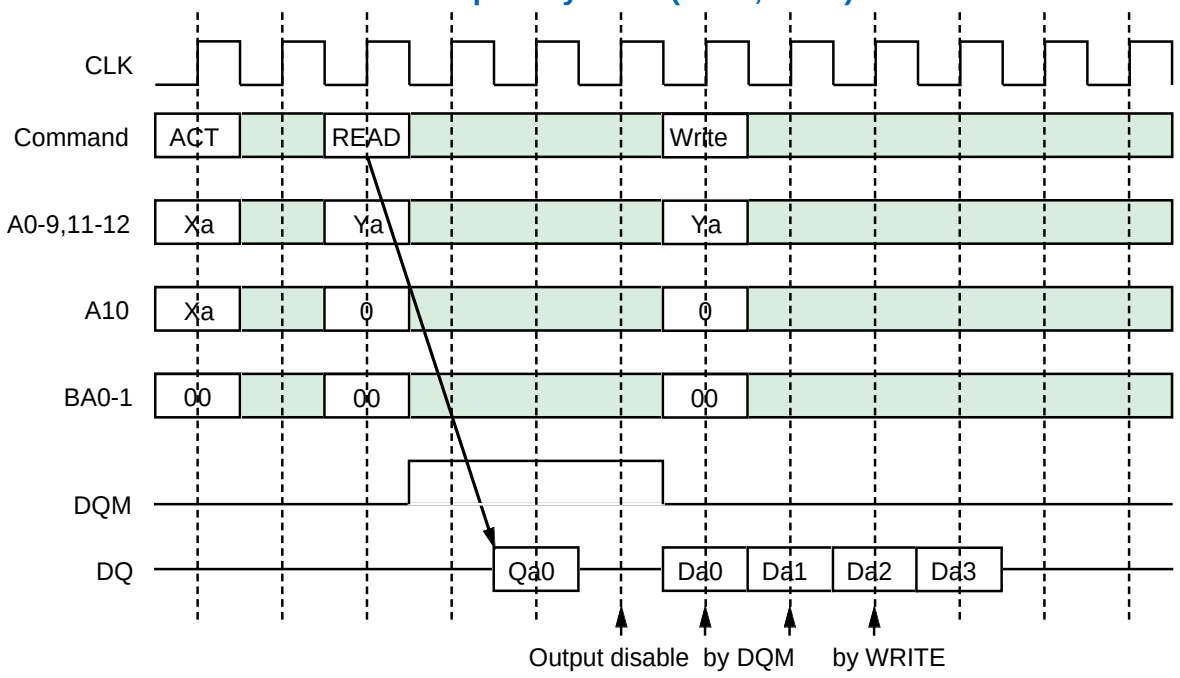
Read interrupted by Read (CL=2, BL=4)



[Read Interrupted by Write]

Burst read operation can be interrupted by write of any bank. Random column access is allowed. In this case, the DQ should be controlled adequately by using the DQM to prevent the bus contention. The output is disabled automatically 2 cycle after WRITE assertion.

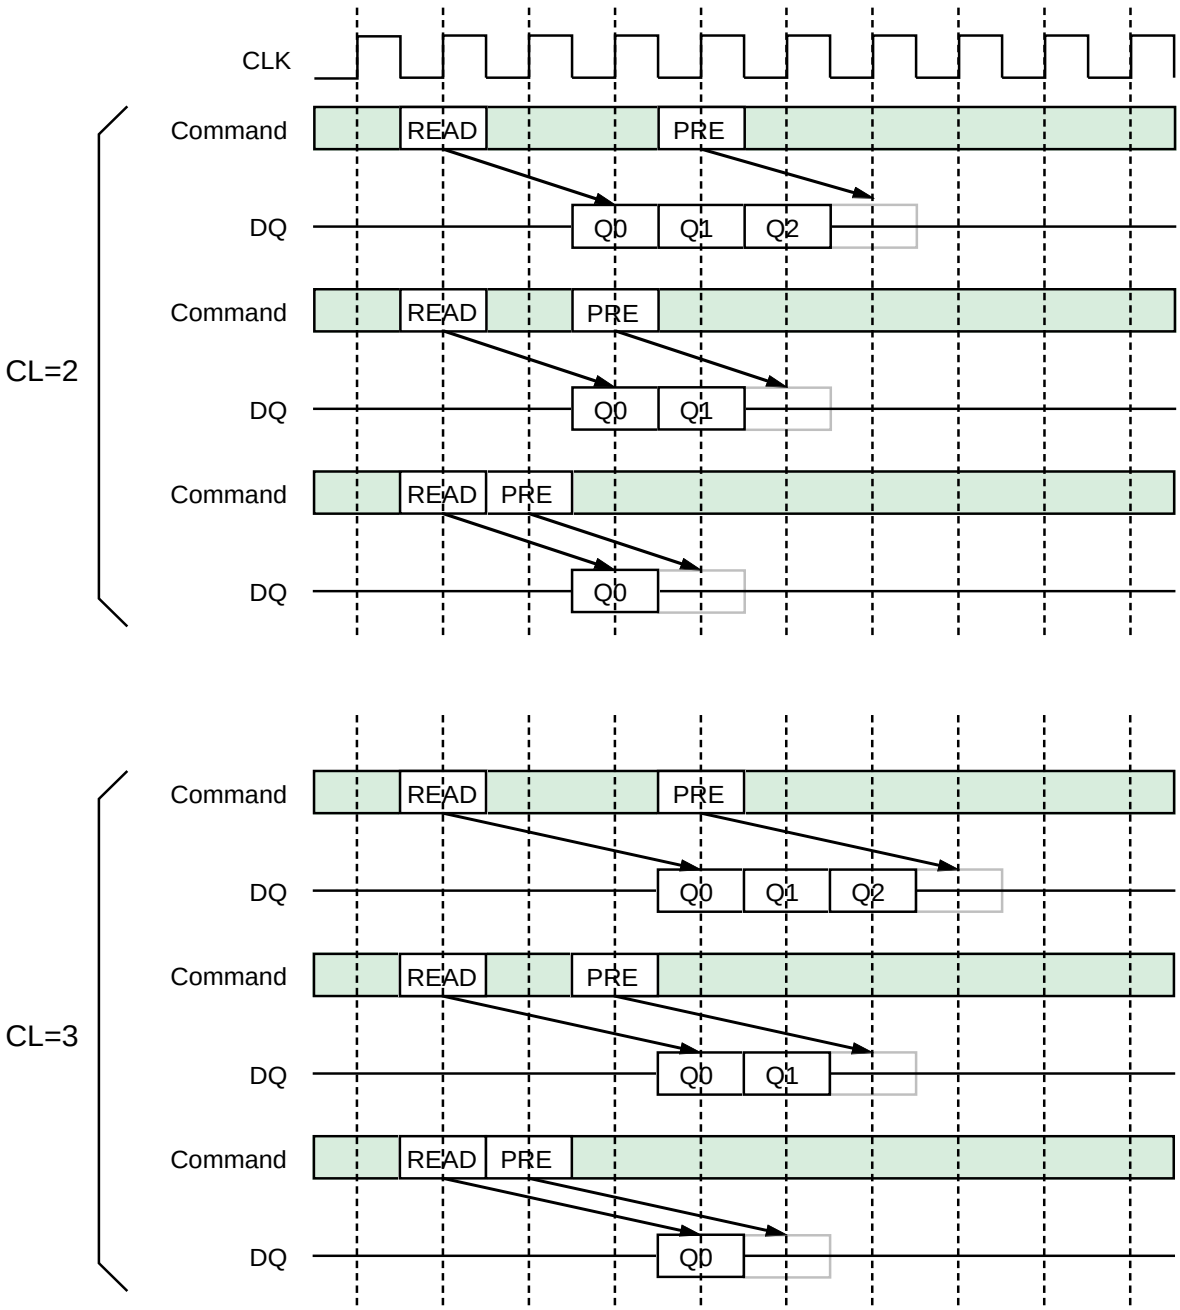
Read interrupted by Write (CL=2, BL=4)



[Read Interrupted by Precharge]

Burst read operation can be interrupted by precharge of the same bank . READ to PRE interval is minimum 1 CLK. A PRE command to output disable latency is equivalent to the /CAS Latency. As a result, READ to PRE interval determines valid data length to be output. The figure below shows examples of BL=4.

Read interrupted by Precharge (BL=4)

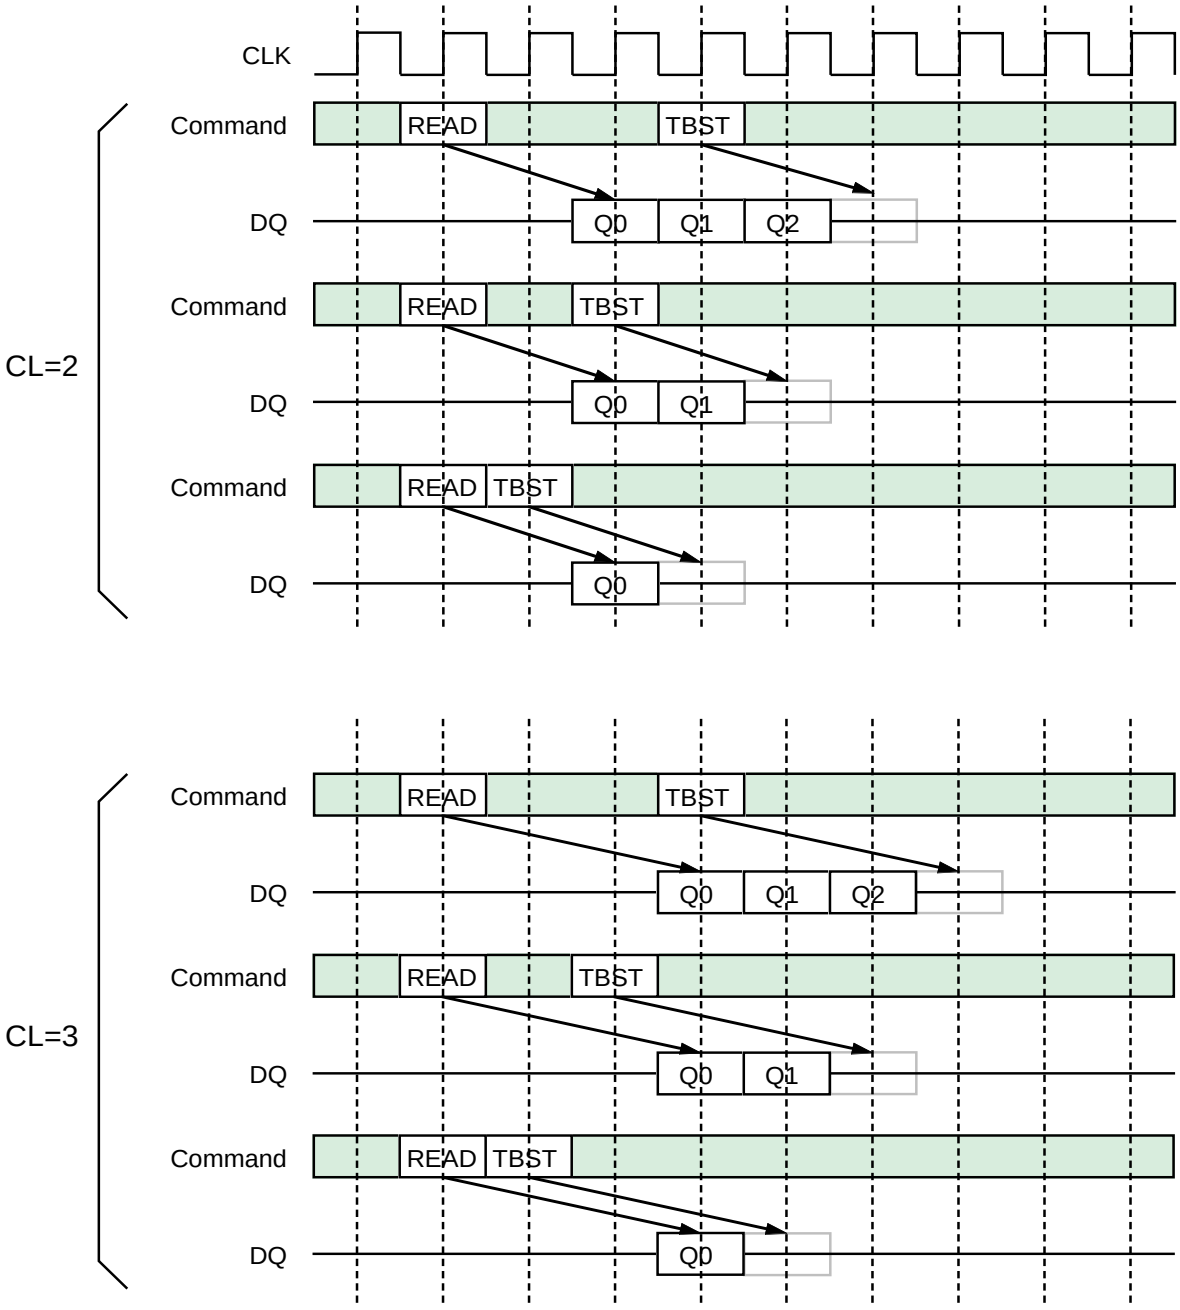


[Read Interrupted by Burst Terminate]

Similarly to the precharge, a burst terminate command can interrupt the burst read operation and disable the data output. The terminated bank remains active.

READ to TBST interval is minimum 1 CLK. A TBST command to output disable latency is equivalent to the /CAS Latency.

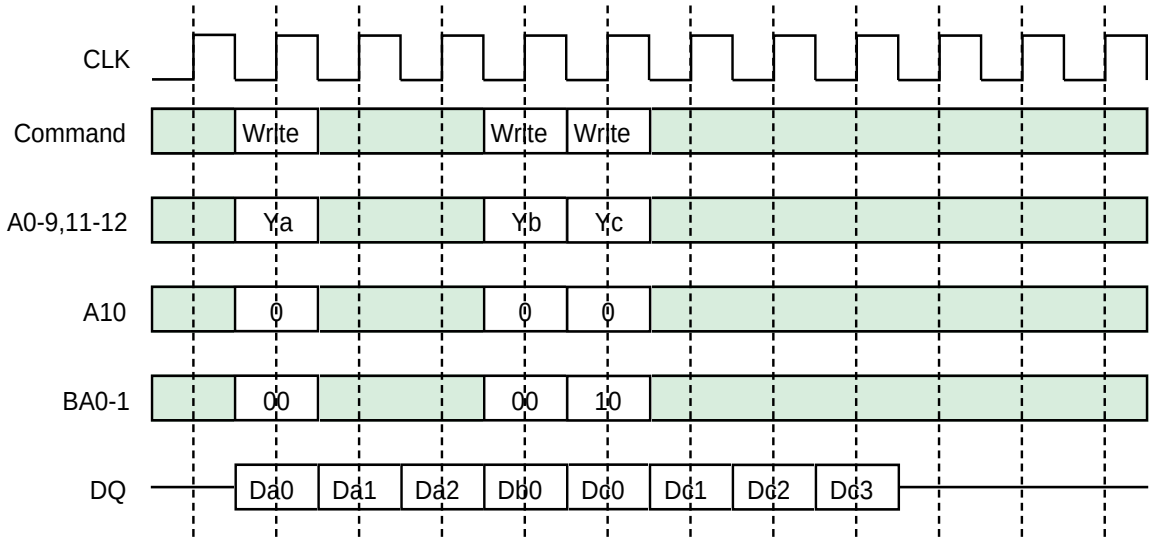
Read interrupted by Terminate (BL=4)



[Write Interrupted by Write]

Burst write operation can be interrupted by new write of any bank. Random column access is allowed. WRITE to WRITE interval is minimum 1 CLK.

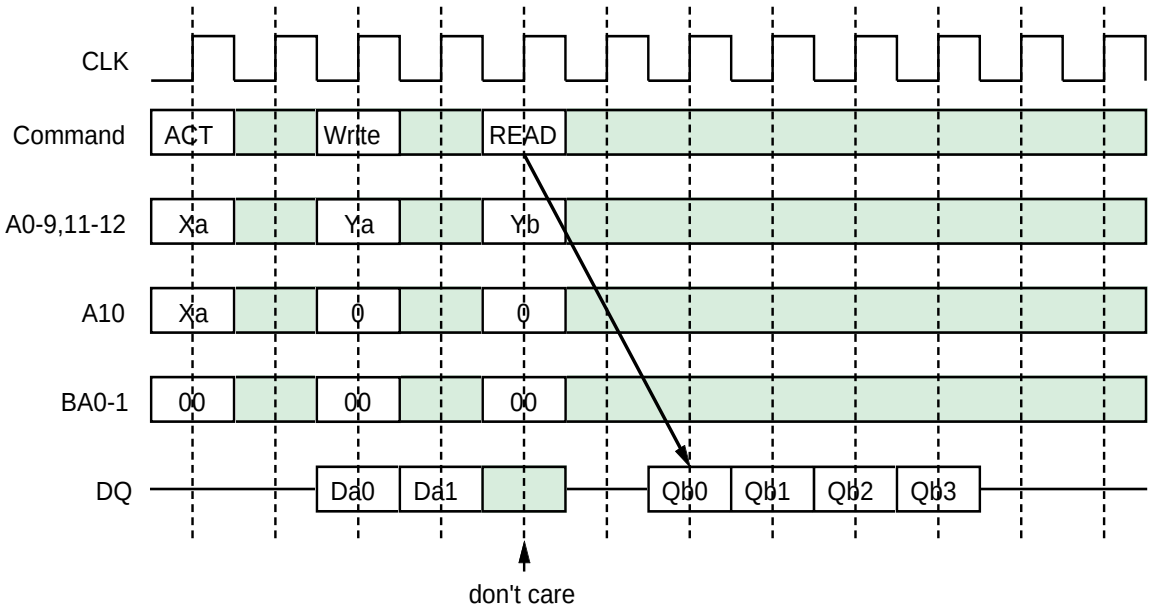
Write interrupted by Write (BL=4)



[Write Interrupted by Read]

Burst write operation can be interrupted by read of the same or the other bank. Random column access is allowed. WRITE to READ interval is minimum 1 CLK. The input data on DQ at the interrupting READ cycle is "don't care".

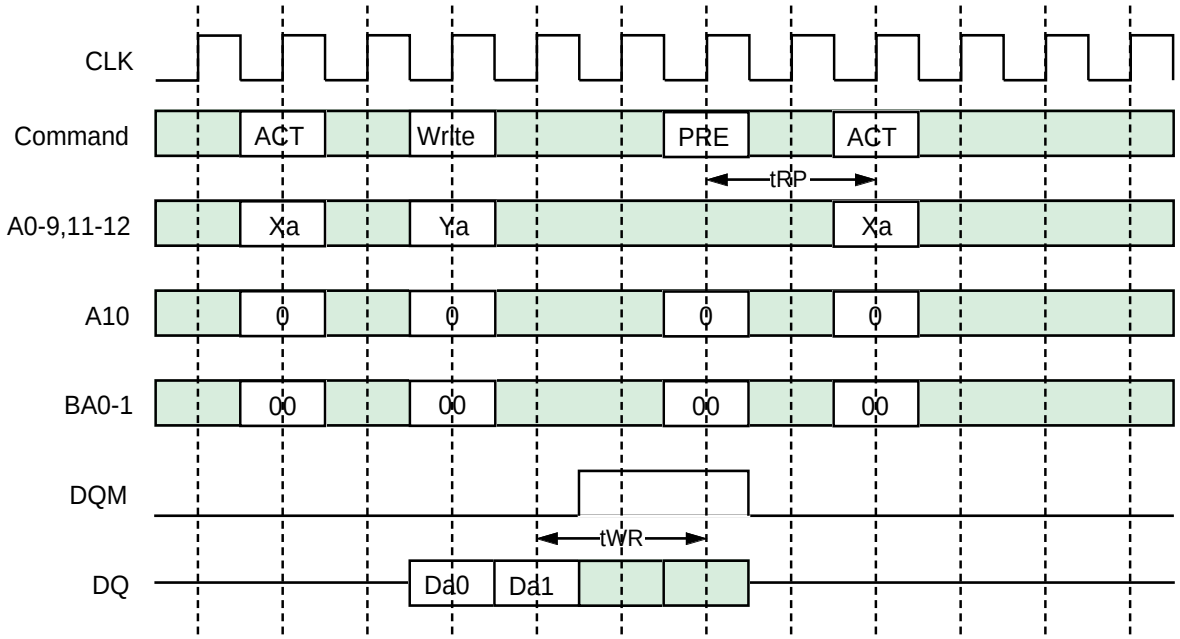
Write interrupted by Read (CL=2, BL=4)



[Write Interrupted by Precharge]

Burst write operation can be interrupted by precharge of the same bank.Write recovery time(tWR) is required from the last data to PRE command. During write recovery, data inputs must be masked by DQM.

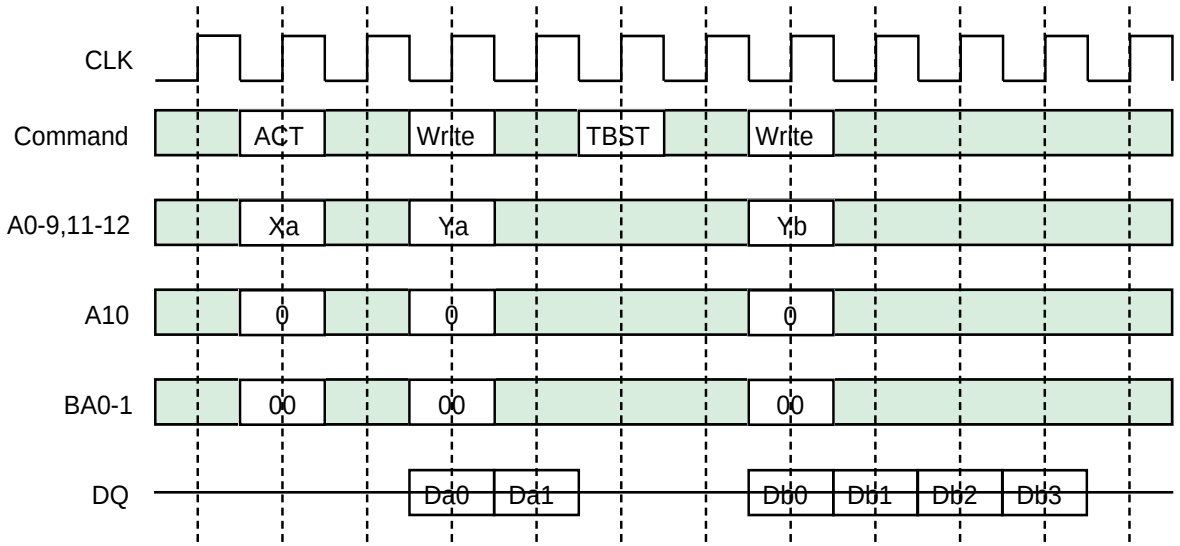
Write interrupted by Precharge (BL=4)



[Write Interrupted by Burst Terminate]

Burst terminate command can terminate burst write operation.In this case, the write recovery time is not required and the bank remains active. WRITE to TBST interval is minimum 1 CLK.

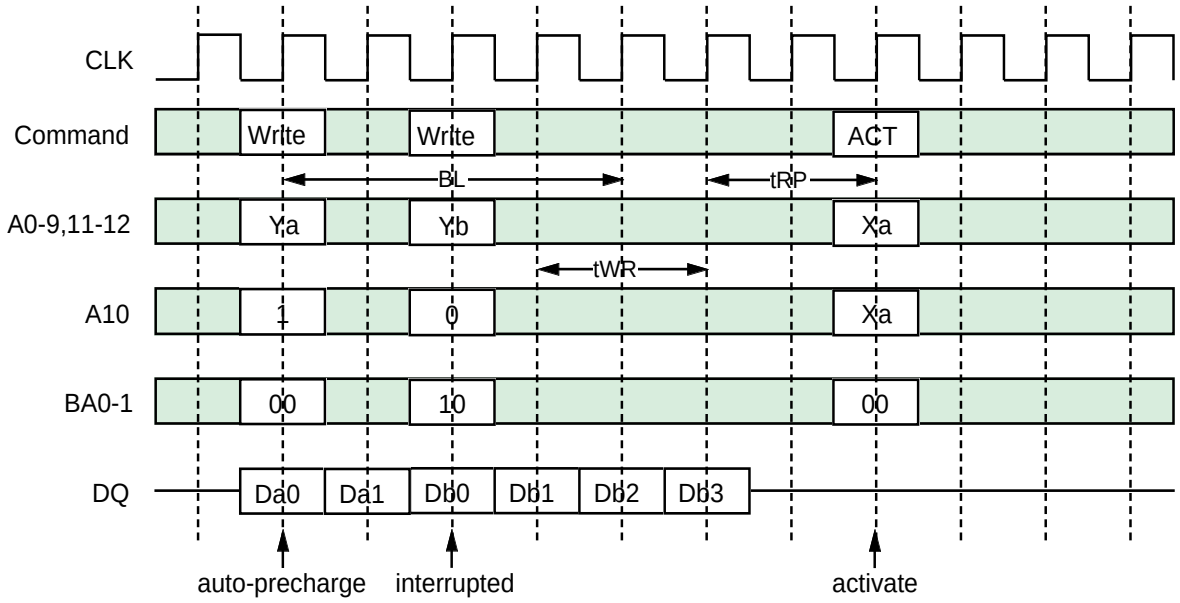
Write interrupted by Terminate (BL=4)



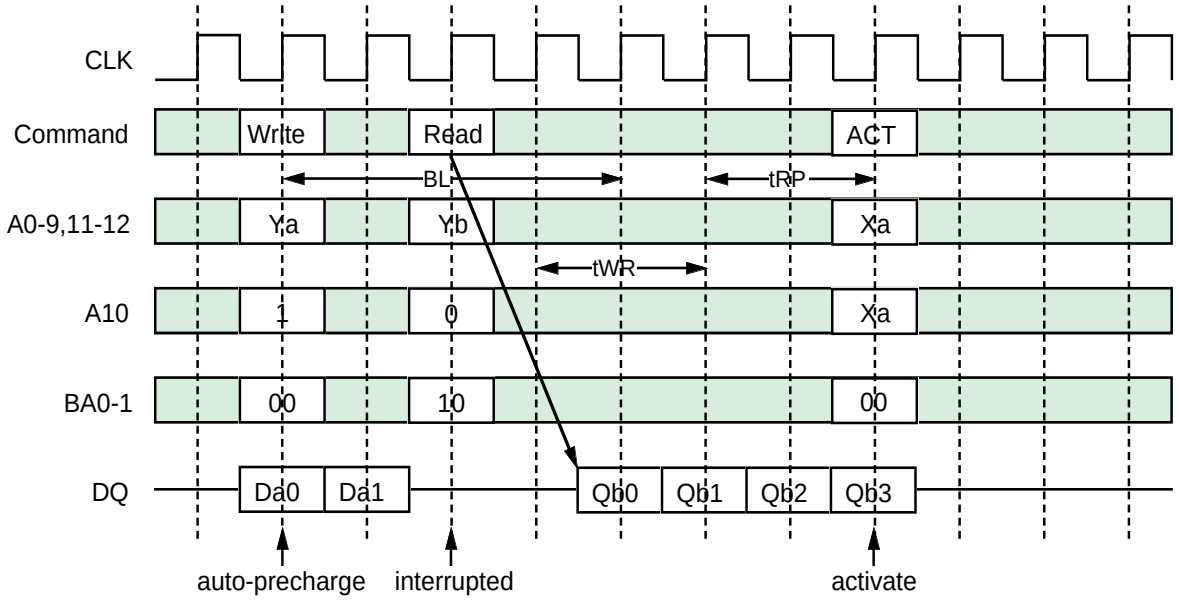
[Write with Auto-Precharge Interrupted by Write or Read to another Bank]

Burst write with auto-precharge can be interrupted by write or read to another bank. Next ACT command can be issued after(BL+tWR-1+ tRP) from the WRITEA. Auto-precharge interruption by a command to the same bank is inhibited.

WRITEA interrupted by WRITE to another bank (BL=4)



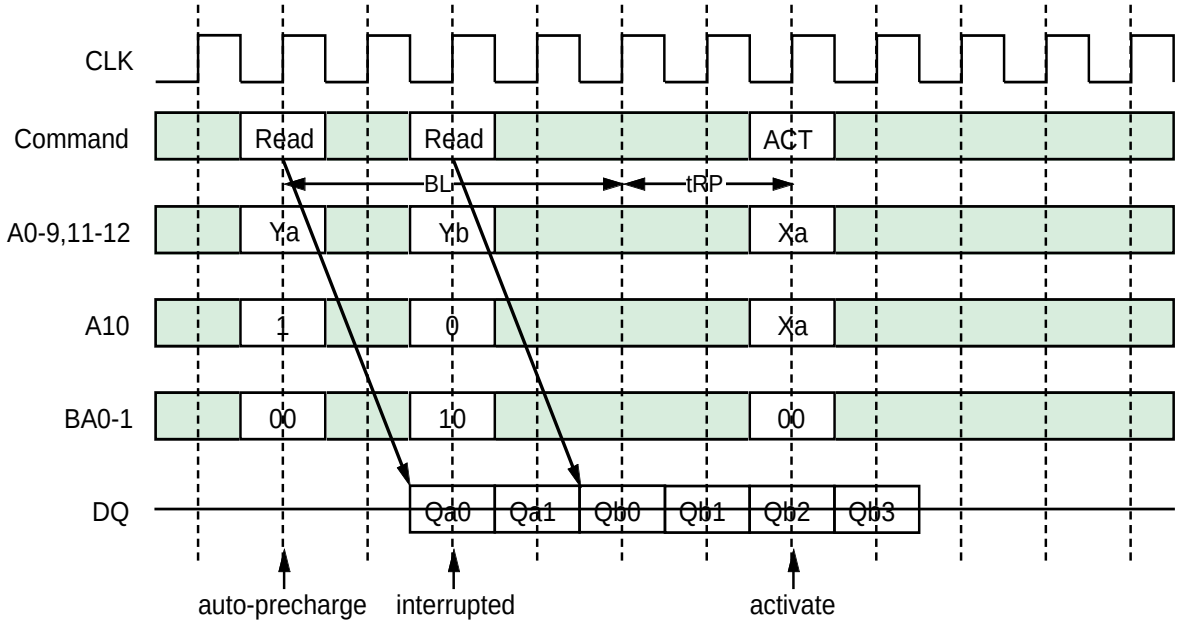
WRITEA interrupted by READ to another bank (CL=2, BL=4)



[Read with Auto-Precharge Interrupted by Read to another Bank]

Burst write with auto-precharge can be interrupted by write or read to another bank. Next ACT command can be issued after (BL+tRP) from the READA. Auto-precharge interruption by a command to the same bank is inhibited.

READA interrupted by READ to another bank (CL=2, BL=4)



[Full Page Burst]

Full page burst length is available for only the sequential burst type. Full page burst read or write is repeated untill a Precharge or a Burst Terminate command is issued. In case of the full page burst, a read or write with auto-precharge command is illegal.

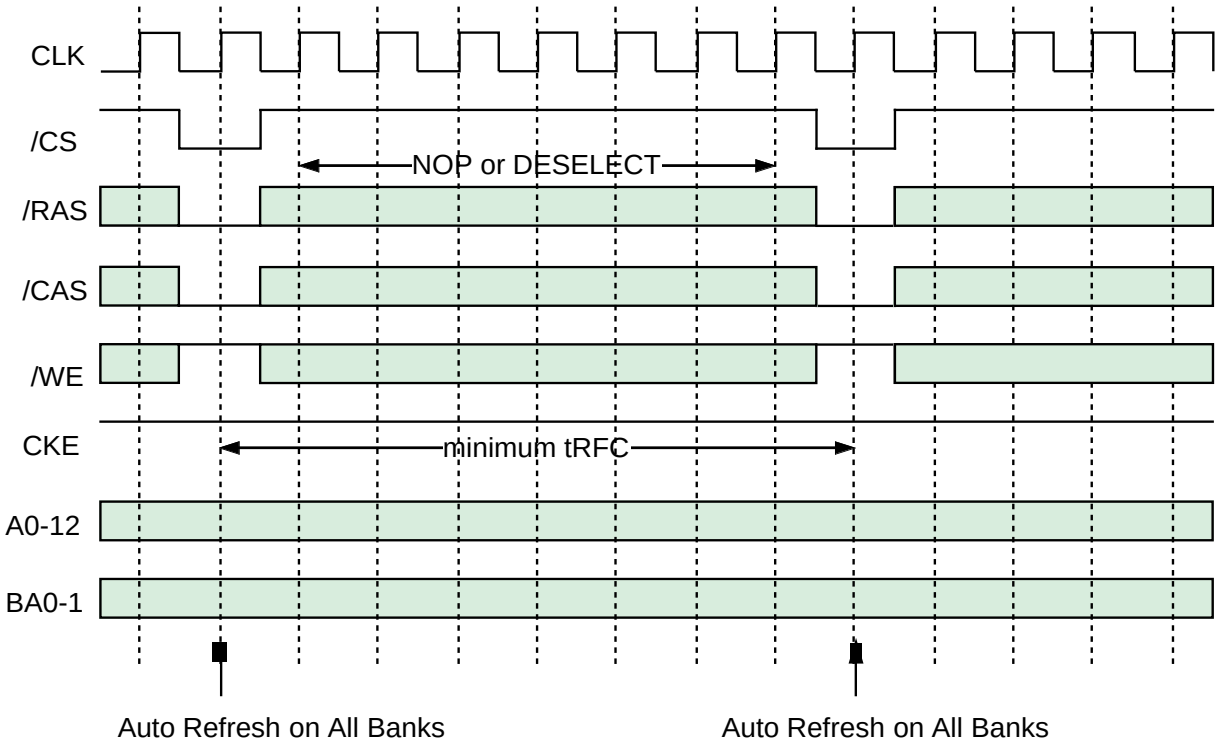
[Single Write]

When single write mode is set, burst length for write is always one, independently of Burst Length defined by (A2-0).

AUTO REFRESH

Single cycle of auto-refresh is initiated with a REFA (/CS= /RAS= /CAS= L, /WE= /CKE= H) command. The refresh address is generated internally. 8192 REFA cycles within 64ms refresh 256M bit memory cells. The auto-refresh is performed on 4 banks concurrently. Before performing an auto-refresh, all banks must be in the idle state. Auto-refresh to auto-refresh interval is minimum tRFC. Any command must not be supplied to the device before tRFC from the REFA command.

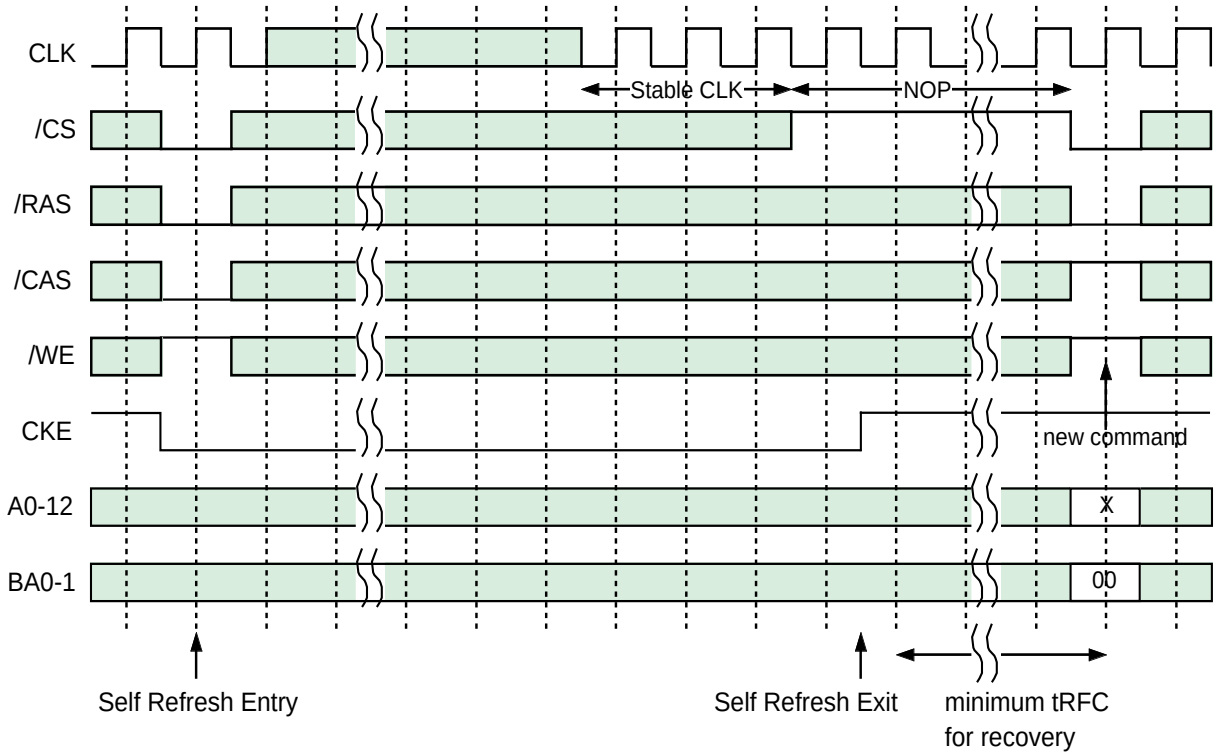
Auto-Refresh



SELF REFRESH

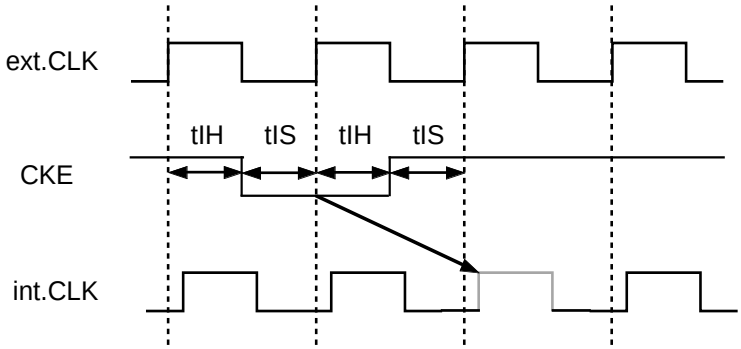
Self-refresh mode is entered by issuing a REFS command (/CS= /RAS= /CAS= L, /WE= H, CKE= L). Once the self-refresh is initiated, it is maintained as long as CKE is kept low. During the self-refresh mode, CKE is asynchronous and the only enabled input . All other inputs including CLK are disabled and ignored, so that power consumption due to synchronous inputs is saved. To exit the self-refresh, supplying stable CLK inputs, asserting DESEL or NOP command and then asserting CKE=H. After tRFC from the 1st CLK egde following CKE=H, all banks are in the idle state and a new command can be issued, but DESEL or NOP commands must be asserted till then.

Self-Refresh

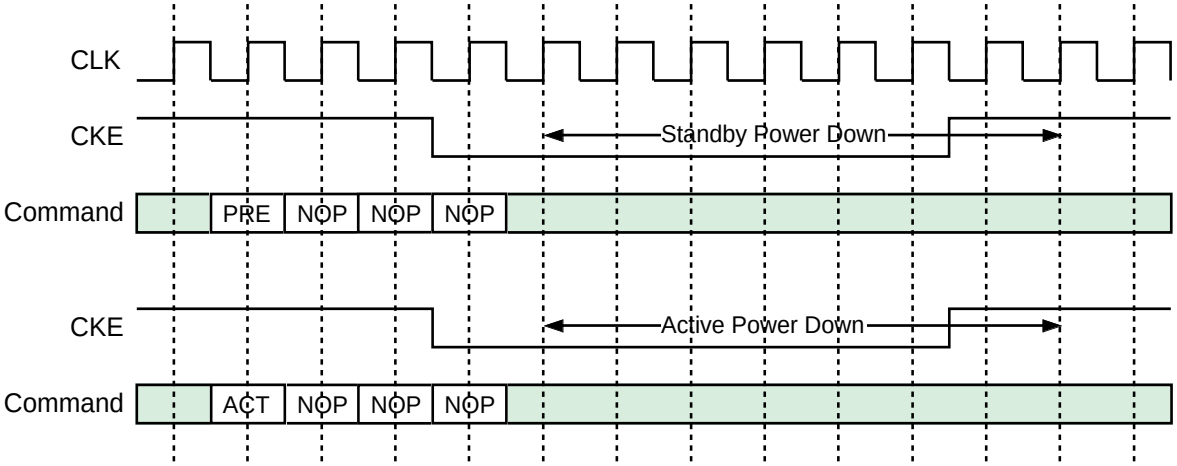


CLK SUSPEND

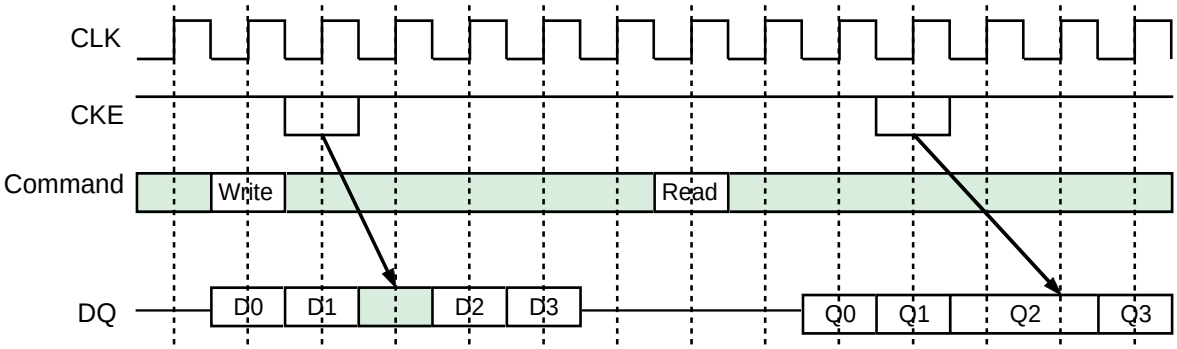
CKE controls the internal CLK at the following cycle. Figure below shows how CKE works. By negating CKE, the next internal CLK is suspended. The purpose of CLK suspend is power down, output suspend or input suspend. CKE is a synchronous input except during the self-refresh mode. CLK suspend can be performed either when the banks are active or idle. A command at the suspended cycle is ignored.



Power Down by CKE



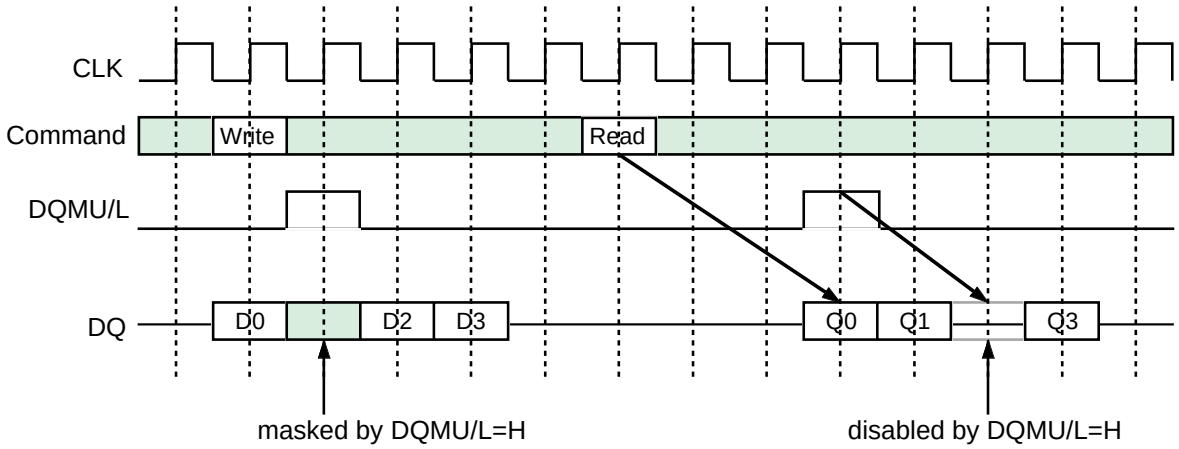
DQ Suspend by CKE



DQM CONTROL

DQM is a dual function signal defined as the data mask for writes and the output disable for reads. During writes, DQM(U,L) masks input data word by word. DQM(U,L) to write mask latency is 0. During reads, DQM(U,L) forces output to Hi-Z word by word. DQM(U,L) to output Hi-Z latency is 2.

DQM Function



ABSOLUTE MAXIMUM RATINGS

VI	Input Voltage	with respect to Vss	-0.5 - 4.6	V
VO	Output Voltage	with respect to VssQ	-0.5 - 4.6	V
IO	Output Current		50	mA
Pd	Power Dissipation	Ta = 25˚C	1000	mW
Topr	Operating Temperature		0 - 70	˚C
Tstg	Storage Temperature		-65 - 150	˚C

RECOMMENDED OPERATING CONDITIONS

(Ta=0 - 70 ˚C ,unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
Vdd	Supply Voltage	3.0	3.3	3.6	V
Vss	Supply Voltage	0	0	0	V
VddQ	Supply Voltage for output	3.0	3.3	3.6	V
VssQ	Supply Voltage for output	0	0	0	V
VIH*1	High-Level Input Voltage all inputs	2.0		VddQ +0.3	V
VIL*2	Low-level Input Voltage all inputs	-0.3		0.8	V

CAPACITANCE

(Ta=0 -70˚C,Vdd=VddQ=3.3± 0.3V, Vss=VssQ=0V, unless otherwise noted)

Symbol	Parameter	Test Condition	Limits (min.)	Limits (max.)		Unit
				-6 /-7	-75	
CI(A)	Input Capacitance, address pin	@ 1MHz 1.4V bias 200mV swing Vcc=3.3V	2.5	3.8	5.0	pF
CI(C)	Input Capacitance, contorl pin		2.5	3.8	5.0	pF
CI(K)	Input Capacitance, CLK pin		2.5	3.5	4.0	pF
CI/O	Input Capacitance, I/O pin		4.0	6.5	6.5	pF

AVERAGE SUPPLY CURRENT from Vdd

(Ta=0 - 70˚C, Vdd=VddQ=3.3±0.3V,Vss=VssQ=0V, unless otherwise noted)

ITEM	Symbol		Organi-zation	Limits (max.)			Unit	Note
				-6	-7	-75		
Operating current	Icc1	tRC=min, tCLK=min BL=1,IOL=0mA	x8	-	-	110	mA	1
			x16	130	130	-	mA	
Precharge Standby current in Non-Power down mode	Icc2N	CKE=VILmax tCLK=15ns	x8/x16	20	20	20	mA	2,3
	Icc2NS	CKE=VIHmin CLK=VILmax(fixed)	x8/x16	15	15	15	mA	2,4
Precharge Standby current in Power down mode	Icc2P	CKE=VIHmin tCLK=15ns(Note)	x8/x16	2	2	2	mA	2
	Icc2PS	CKE=VIHmin tCLK=VILmax(fixed)	x8/x16	2	2	2	mA	
Active Standby current	Icc3N	CKE=/CS=VIHmin tCLK=15ns(Note)	x8/x16	30	30	30	mA	3,5
	Icc3NS	CKE=VIHmin tCLK=VILmax(fixed)	x8/x16	20	20	20	mA	4,5
Burst current	Icc4	All Bank Active tCLK = min BL=4, CL=3, IOL=0mA	x8	-	-	150	mA	5
			x16	160	160	-	mA	
Auto-refresh current	Icc5	tRC=min, tCLK=min	x8/x16	160	160	160	mA	
Self-refresh current	Icc6	CKE < 0.2V	x8/x16	-6,-7,-75	3	3	3	mA

NOTE:

1.address are changed 3 times during tRC , only 1 bank is active & all other banks are idle
2.all banks are idle
3.input signals are changed one time during 3x tCLK
4.input signals are stable
5.all banks are active

AC OPERATING CONDITIONS AND CHARACTERISTICS

(Ta=0 - 70˚C, Vdd=VddQ=3.3±0.3V,Vss=VssQ=0V, unless otherwise noted)

Symbol	Parameter	Test Conditions	Limits		unit
			Min.	Max.	
VOH (DC)	High-Level Output Voltage (DC)	IOH=-2mA	2.4	-	V
VOL (DC)	Low-level Output Voltage (DC)	IOL= 2mA	-	0.4	V
IOZ	Off-state Output Current	Q floating VO=0 -- VddQ	-10	10	µA
I_I	Input Current	VIH = 0 -- VddQ +0.3V	-10	10	µA

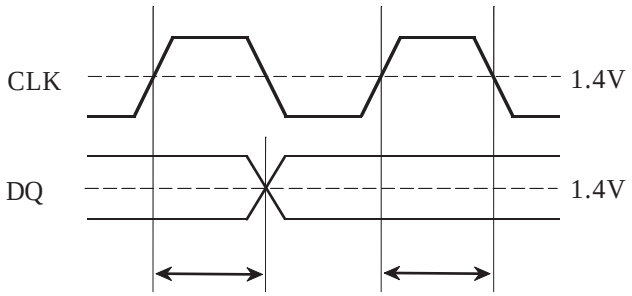
AC TIMING REQUIREMENTS

(Ta=0 - 70˚C, Vdd=VddQ=3.3±0.3V,Vss=VssQ=0V, unless otherwise noted)

Input Pulse Levels:0.8V-2.0V

Input Timing Measurement Level:1.4V

Symbol	Parameter		Limits						Unit
			-6		-7		-75		
			Min.	Max.	Min.	Max.	Min.	Max.	
tCLK	CLK cycle time	CL=2	-		-		10		ns
		CL=3	6		7		7.5		ns
tCH	CLK High pulse width		2		2.5		2.5		ns
tCL	CLK Low pulse width		2		2.5		2.5		ns
tT	Transition time of CLK		1	10	1	10	1	10	ns
tIS	Input Setup time (all inputs)		1.8		1.8		1.8		ns
tIH	Input Hold time (all inputs)		1		1		1		ns
tRC	Row Cycle time		60		63		67.5		ns
tRFC	Refresh Cycle Time		60		70		75		ns
tRCD	Row to Column Delay		15		20		20		ns
tRAS	Row Active time		42	120K	45	120K	45	120K	ns
tRP	Row Precharge time		15		20		20		ns
tWR	Write Recovery time		12		14		15		ns
tRRD	Act to Act Delay time		12		14		15		ns
tRSC	Mode Register Set Cycle time		12		14		15		ns
tREF	Refresh Interval time			7.8		7.8		7.8	us



Any AC timing is referenced to the input signal passing through 1.4V.

SWITCHING CHARACTERISTICS

(Ta=0 - 70˚C, Vdd=VddQ=3.3±0.3V,Vss=VssQ=0V, unless otherwise noted)

Symbol	Parameter		Limits						Unit	Note
			-6		-7		-75			
			Min.	Max.	Min.	Max.	Min.	Max.		
tAC	Access time from CLK	CL=2						6	ns	
		CL=3		5		5.4		5.4	ns	
tOH	Output Hold time from CLK	CL=2					3		ns	
		CL=3	2.5		2.7		3		ns	*1
tOLZ	Delay time , output low-impedance from CLK		0		0		0		ns	
tOHZ	Delay time , output high-impedance from CLK		2.5	5	2.7	5.4	3	5.4	ns	

NOTE:

1. If clock rising time is longer than 1ns,(tr/2-0.5ns) should be added to the parameter.

ORDERING INFORMATION

Commercial Range: 0°C to +70°C

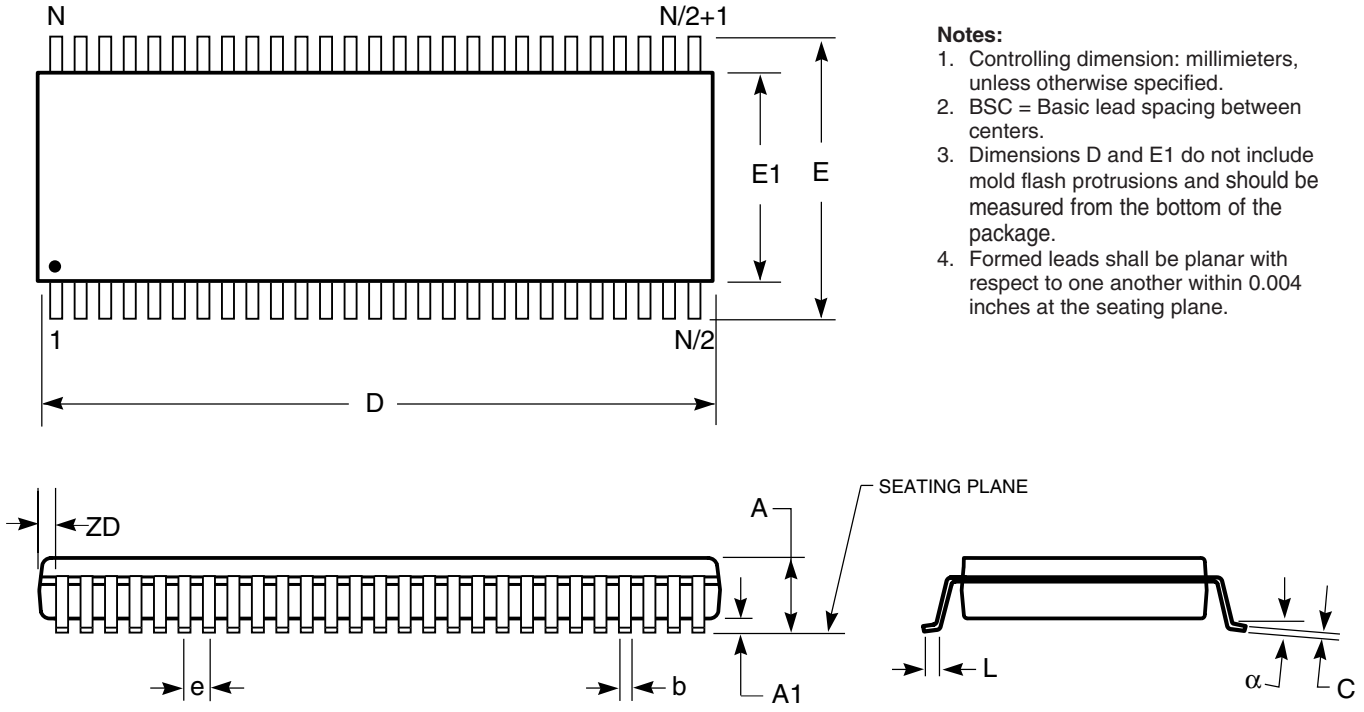
Frequency	Speed (ns)	Order Part No.	Package
166 MHz	6	IS42S16160A-6T	54-pin TSOP-II
143 MHz	7	IS42S16160A-7T	54-pin TSOP-II
133 MHz	7.5	IS42S83200A-75T	54-pin TSOP-II

Commercial Range: 0°C to +70°C, Lead-free

Frequency	Speed (ns)	Order Part No.	Package
166 MHz	6	IS42S16160A-6TL	54-pin TSOP-II
143 MHz	7	IS42S16160A-7TL	54-pin TSOP-II
133 MHz	7.5	IS42S83200A-75TL	54-pin TSOP-II

PACKAGING INFORMATION

Plastic TSOP 54–Pin, 86-Pin
Package Code: T (Type II)



Notes:
1. Controlling dimension: millimieters, unless otherwise specified.
2. BSC = Basic lead spacing between centers.
3. Dimensions D and E1 do not include mold flash protrusions and should be measured from the bottom of the package.
4. Formed leads shall be planar with respect to one another within 0.004 inches at the seating plane.
