**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** A heat sink may be required to keep the junction temperature below the absolute maximum. This depends on the power supply voltage and the total output current.

**Note 3:** The LTC6087C/LTC6088C are guaranteed functional over the operating temperature range of  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ . The LTC6087H/LTC6088H are guaranteed functional over the operating temperature range of  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ .

**Note 4:** The LTC6087C/LTC6088C are guaranteed to meet specified performance from  $0^\circ\text{C}$  to  $70^\circ\text{C}$ . The LTC6087C/LTC6088C are designed, characterized and expected to meet specified performance from  $-40^\circ\text{C}$  to  $125^\circ\text{C}$  but are not tested or QA sampled at these temperatures.

The LTC6087H/LTC6088H are guaranteed to meet specified performance from  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ .

**Note 5:** ESD (electrostatic discharge) sensitive device. ESD protection devices are used extensively internal to the LTC6087/LTC6088; however, high electrostatic discharge can damage or degrade the device. Use proper ESD handling precautions.

**Note 6:** This parameter is not 100% tested.

**Note 7:** This specification is limited by high speed automated test capability. See Typical Performance Characteristic curves for actual performance.

**Note 8:** Current noise is calculated from:

$$i_n = \sqrt{2qI_B}$$

where  $q = 1.6 \cdot 10^{-19}$  coulombs.

## PIN FUNCTIONS

**OUT:** Amplifier Output.

**-IN:** Inverting Input.

**+IN:** Noninverting Input.

**V<sup>+</sup>:** Positive Supply.

**V<sup>-</sup>:** Negative Supply.

**SHDNA:** Shutdown Pin of Amplifier A, active low and only available with the LTC6087DD. An internal current source pulls the pin to V<sup>+</sup> when floating.

**SHDNB:** Shutdown Pin of Amplifier B, active low and only available with the LTC6087DD. An internal current source pulls the pin to V<sup>+</sup> when floating.

**NC:** Not internally connected

**Exposed Pad:** Connected to V<sup>-</sup>.

## APPLICATIONS INFORMATION

### Rail-to-Rail Input

The input stage of LTC6087/LTC6088 combines both PMOS and NMOS differential pairs, extending its input common mode voltage to both positive and negative supply voltages. At high input common mode range, the NMOS pair is on. At low common mode range, the PMOS pair is on. The transition happens when the common voltage is between 1.3V and 0.9V below the positive supply.

### Achieving Low Input Bias Current

The DD and DHC packages are leadless and make contact to the PCB beneath the package. Solder flux used during the attachment of the part to the PCB can create leakage current paths and can degrade the input bias current performance of the part. All inputs are susceptible because the backside paddle is connected to V<sup>-</sup> internally. As the input voltage or V<sup>-</sup> changes, a leakage path can be formed and alter the observed input bias current. For lowest bias current use the LTC6087/LTC6088 in the leaded MSOP/

GN package. With fine PCB design rules, you can also provide a guard ring around the inputs.

For example, in high source impedance applications such as pH probes, photo diodes, strain gauges, et cetera, the low input bias current of these parts requires a clean board layout to minimize additional leakage current into a high impedance signal node. A mere 100GΩ of PC board resistance between a 5V supply trace and input trace near ground potential adds 50pA of leakage current. This leakage is far greater than the bias current of the operational amplifier. A guard ring around the high impedance input traces driven by a low impedance source equal to the input voltage prevents such leakage problems. The guard ring should extend as far as necessary to shield the high impedance signal from any and all leakage paths. Figure 1 shows the use of a guard ring in a unity-gain configuration. In this case the guard ring is connected to the output and is shielding the high impedance noninverting input from V<sup>-</sup>. Figure 2 shows the inverting gain configuration.

## APPLICATIONS INFORMATION

### Rail-to-Rail Output

The output stage of the LTC6087/LTC6088 swings within 30mV of the supply rails when driving high impedance loads, in other words when no DC load current is present. See the Typical Performance Characteristics for curves of output swing versus load current. The class AB design of the output stage enables the op amp to supply load currents which are much greater than the quiescent supply current. For example, the room temperature short circuit current is typically 45mA.

### Capacitive Load

LTC6087/LTC6088 can drive capacitive load up to 100pF in unity gain. The capacitive load driving capability increases as the amplifier is used in higher gain configurations. A small series resistance between the output and the load further increases the amount of capacitance the amplifier can drive.

### SHDN Pins

Pins 5 and 6 are used for power shutdown when the LTC6087 is in the DD package. If they are floating, internal current sources pull Pins 5 and 6 to  $V^+$  and the amplifiers operate normally. In shutdown the amplifier output is high impedance and each amplifier draws less than 5 $\mu$ A current. This feature allows the part to be used in muxed output applications as shown in Figure 3.

### ESD

The LTC6087/LTC6088 has reverse-biased ESD protection diodes on all inputs and outputs as shown in the Simplified Schematic. If these pins are forced beyond either supply, unlimited current will flow through these diodes. If the current is transient and limited to one hundred milliamps or less, no damage to the device will occur.

The amplifier input bias current is the leakage current of these ESD diodes. This leakage is a function of the temperature and common mode voltage of the amplifier, as shown in the Typical Performance Characteristics.

Figure 3. Inverting Amplifier with Muxed Output

### Noise

In the frequency region above 1kHz, the LTC6087/LTC6088 shows good noise voltage performance. In this region, noise can be dominated by the total source resistance of the particular application. Specifically, these amplifiers exhibit the noise of a 10k resistor, meaning it is desirable to keep the source and feedback resistance at or below this value, i.e.,  $R_S + R_G || R_{FB} \leq 10k$ . Above this total source impedance, the noise voltage is dominated by the resistor.

At low frequency, noise current can be estimated from the expression  $i_n = \sqrt{2qI_B}$ , where  $q = 1.6 \cdot 10^{-19}$  coulombs. Equating  $\sqrt{4kTR\Delta f}$  and  $R\sqrt{2qI_B\Delta f}$  shows that for source resistor below 50G $\Omega$  the amplifier noise is dominated by the source resistance. Noise current rises with frequency. See the curve Noise Current vs Frequency in the Typical Performance Characteristics section.

### GN Package 16-Lead Plastic SSOP (Narrow .150 Inch) (Reference LTC DWG # 05-08-1641 Rev B)

**REVISION HISTORY** (Revision history begins at Rev C)

| REV | DATE | DESCRIPTION                                                 | PAGE NUMBER |
|-----|------|-------------------------------------------------------------|-------------|
| C   | 7/12 | Corrected Supply Current value.                             | 1           |
|     |      | Provided $V_{CM}$ condition for GBW specification.          | 4, 5        |
| D   | 6/17 | Provided $V_{CM}$ condition for Phase Margin specification. | 4, 5        |

TYPICAL APPLICATIONS

Negative-Going and Positive-Going Photodiode TIAs on ±5V Supplies

Almost Rail-to-Rail (0.3V to VCC) Gain-of-30 Current Sense Amplifier
