Low-Voltage, Dual DPDT/Quad SPDT Analog Switches in QFN

ABSOLUTE MAXIMUM RATINGS

(Voltages Referenced to GND)
V+ .....-0.3V to +6V
V_L, IN_, COM_, NO_, NC_ (Note1)..... -0.3V to (V+ + 0.3V)
Continuous Current COM_, NO_, NC_ ..... ±20mA
Peak Current COM_, NO_, NC_
(pulsed at 1ms, 10% duty cycle).....±40mA

Continuous Power Dissipation (T_A = +70°C)
TSSOP (derate 9.4mW/°C above +70°C) 754.7mW
16-Pin TQFN (derate 20.8mW/°C
above +70°C).....1666.7mW
16-Pin Thin QFN (derate 25mW/°C
above +70°C).....2000mW
Operating Temperature Range ..... -40°C to +85°C
Storage Temperature Range ..... -65°C to +150°C
Lead Temperature (soldering, 10s) ..... +300°C
Soldering Temperature (reflow) .....+260°C

Note 1: Signals on IN_, COM_, NO_, and NC_ exceeding 0 or V+ are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS—Single +3V Supply

(V+ = +2.7V to +3.3V, V_{GND} = 0V, V_{IH} = +1.4V, V_{IL} = +0.5V, (V_L = +1.5V, V_{IH} = +1.0V, V_{IL} = +0.4V for MAX4702 only), T_A = -40°C to +85°C. Typical values are at V+ = +3V and T_A = +25°C, unless otherwise noted.) (Notes 2, 3)

Note 2: The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.
Note 3: -40°C specifications are guaranteed by design.
Note 4: $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$.
Note 5: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges.
Note 6: Guaranteed by design.
Note 7: Off-Isolation = 20log10 ($V_{COM\_}$ / V_{NO}), V_{COM} = output, V_{NO} = input to off switch.
Note 8: Between any two switches.

Typical Operating Characteristics

(T_A = +25°C, unless otherwise noted. V_L = +1.5V for MAX4702 only.)

Detailed Description

The MAX4699/MAX4701 are low-voltage CMOS analog switches that operate from a single +1.8V to +5.5V power supply. The MAX4702 requires an additional logic supply that allows for setting lower logic thresholds. The MAX4699/MAX4701 are double-pole/double-throw (DPDT) devices. The MAX4702 is a quad single-pole/double-throw (SPDT) device. These devices feature a break-before-make switching, fast switching speeds (with V+ = 5V: t_{ON} = 18ns max, t_{OFF} = 9ns max and with V+ = 3V: t_{ON} = 35ns, t_{OFF} = 20) and rail-to-rail signal handling. A logic input on the MAX4702 allows for logic thresholds as low as 1.0V.

Applications Information

Analog Signal Levels

Analog signals that range over the entire supply voltage (V+ to GND) can be passed with very little change in on-resistance (see *Typical Operating Characteristics*). The switches are bidirectional, so the NO, NC, and COM pins can be used as either inputs or outputs.

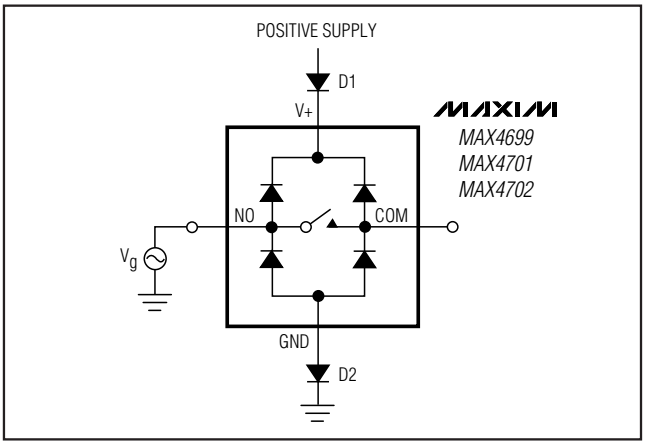

Figure 1. Overvoltage Protection Using Two External Blocking Diodes

Low-Voltage, Dual DPDT/Quad SPDT Analog Switches in QFN

Power-Supply Sequencing and Overvoltage Protection

Caution: Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the devices.

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V+ before applying analog signals, especially if the analog signal is not current limited. If this sequencing is not possible, and if the analog inputs are not current limited to <20mA, add a small-signal diode (D1) as shown in Figure 1. If the analog signal can dip below GND, add D2. Adding protection diodes reduces the analog range to a diode drop (about 0.7V) below V+ (for D1), and a diode drop above ground (for D2). On-resistance increases slightly at low supply voltages. Maximum supply voltage (V+) must not exceed +6V.

Adding protection diode D2 causes the logic threshold to be shifted relative to GND. TTL compatibility is not guaranteed when D2 is added.

Protection diodes D1 and D2 also protect against some overvoltage situations. With Figure 1's circuit, if the supply voltage is below the absolute maximum rating, and if a fault voltage up to the absolute maximum rating is applied to an analog signal pin, no damage will result.

V_L Logic Input (MAX4702)

The MAX4702 features a V_L logic input that allows for lower logic input thresholds down to 1.0V min for V_{IH} in the quad SPDT configuration. Power-up V_L after V+ has been powered with a minimum of 1.5V to ensure proper operation of the device.
