## Description

The SP3224E and SP3225E are 2-driver/2-receiver devices. The SP3226E and SP3227E are 1-driver/1-receiver devices. All are ideal for serial ports in embedded, consumer, portable, or handheld applications. The transceivers meet the EIA/TIA-232 and ITU-T V.28/V.24 communication protocols for reliable serial communication. The devices feature Exar's proprietary and patented (U.S. 5,306,954) on-board charge pump circuitry that generates  $\pm 5.5\text{V}$  RS-232 voltage levels from a single +3.0V to +5.5V power supply.

The SP3224E-SP3227E are ideal choices for power sensitive designs. With the Auto On-line<sup>®</sup> Plus enabled, the SP3224E-SP3227E reduce supply current to  $1\mu\text{A}$  whenever the transceivers are in idle. In shutdown, the internal charge pump and the drivers will shut down. This feature allows design engineers to address power saving concerns without major design changes.

## Theory Of Operation

The SP3224E-SP3227E are made up of four basic circuit blocks: 1. Drivers, 2. Receivers, 3. the Exar proprietary charge pump, and 4. Auto On-line<sup>®</sup> Plus circuitry.

### Drivers

The drivers are inverting level transmitters that convert TTL or CMOS logic levels to 5.0V EIA/TIA-232 levels with an inverted sense relative to the input logic levels. Typically, the RS-232 output voltage swing is +5.4V with no load and +5V minimum fully loaded. The driver outputs are protected against infinite short-circuits to ground without degradation in reliability. These drivers comply with the EIA-TIA-232-F and all previous RS-232 versions. Unused driver inputs should be connected to GND or VCC.

The drivers can guarantee output data

rates fully loaded with  $3\text{K}\Omega$  in parallel with  $1000\text{pF}$  (SP3224E/SP3226E), or  $3\text{K}\Omega$  in parallel with  $250\text{pF}$  (SP3225E/SP3227E) ensuring compatibility with PC-to-PC communication software. The slew rate of the driver output on the SP3224E/SP3226E is internally limited to a maximum of  $30\text{V}/\mu\text{s}$  in order to meet the EIA standards (EIA RS-232D 2.1.7, Paragraph 5). The Slew Rate of SP3225E/SP3227E is not limited to enable higher speed data transfers. The transition of the loaded output from HIGH to LOW also meets the monotonic signal transition requirements of the standard.

### Receivers

The receivers convert EIA/TIA-232 signal levels to TTL or CMOS logic output levels. Receivers remain active during device shutdown. Since receiver input is usually from a transmission line where long cable lengths and system interference can degrade the signal, the inputs have a typical hysteresis margin of 500mV. This ensures that the receiver is virtually immune to noisy transmission lines. Should an input be left unconnected, an internal  $5\text{K}\Omega$  pulldown resistor to ground will commit the output of the receiver to a HIGH state.

### Charge Pump

The charge pump is a Exar-patented design (US Patent #5,306,954) and uses a unique approach compared to older less-efficient designs. The charge pump still requires four external capacitors, but uses a four phase voltage shifting technique to attain symmetrical 5.5V power supplies. The internal power supply consists of a regulated dual charge pump that provides output voltages 5.5V regardless of the input voltage ( $V_{\text{CC}}$ ) over the +3.0V to +5.5V range. This is important to maintain compliant RS-232 levels regardless of power supply fluctuations.

The charge pump operates in a discontinuous mode using an internal oscillator. If the output voltages are less than a magnitude

of 5.5V, the charge pump is enabled. If the output voltages exceed a magnitude of 5.5V, the charge pump is disabled. This oscillator controls the four phases of the voltage shifting. A description of each phase follows.

### Highly Efficient Charge Pump

The charge pump is used to generate positive and negative signal voltages for the RS-232 drivers. This enables fully compliant RS-232 and V.28 signals from a single 3.0 or 5.5V power supply.

The charge pumps use four external capacitors to hold and transfer electrical charge. The Exar patented design (US Patent #5,306,954) uses a unique approach compared to older less efficient designs. The pumps use a four-phase voltage shifting technique to attain symmetrical V+ and V- power supplies. An intelligent control oscillator regulates the operation of the charge pump to maintain the proper voltages at maximum efficiency.

#### Phase 1

V<sub>SS</sub> charge store and double: The positive terminals of capacitors C1 and C2 are charged from V<sub>CC</sub> with their negative terminals initially connected to ground. C1+ is then connected to ground and the stored charge from C1- is superimposed onto C2-. Since C2+ is still connected to V<sub>CC</sub> the voltage potential across capacitor C2 is now 2 x V<sub>CC</sub>.

#### Phase 2

V<sub>SS</sub> transfer and invert: Phase two connects the negative terminal of C2 to the V<sub>SS</sub> storage capacitor and the positive terminal of C2 to ground. This transfers the doubled and inverted (V-) voltage onto C4. Meanwhile, capacitor C1 charged from V<sub>CC</sub> to prepare it for its next phase.

#### Phase 3

V<sub>DD</sub> charge store and double: Phase three

is identical to the first phase. The positive terminals of capacitors C1 and C2 are charged from V<sub>CC</sub> with their negative terminals initially connected to ground. C1+ is then connected to ground and the stored charge from C1- is superimposed onto C2-. Since C2+ is still connected to V<sub>CC</sub> the voltage potential across capacitor C2 is now 2 x V<sub>CC</sub>.

#### Phase 4

V<sub>DD</sub> transfer: The fourth phase connects the negative terminal of C2 to ground and the positive terminal of C2 to the V<sub>DD</sub> storage capacitor. This transfers the doubled (V+) voltage onto C3. Meanwhile, capacitor C1 charged from V<sub>CC</sub> to prepare it for its next phase.

The Exar charge pump generates V+ and V- independently from V<sub>CC</sub>. Hence in a no-load condition V+ and V- will be symmetrical. Older charge pump approaches generate V+ and then use part of that stored charge to generate V-. Because of inherent losses the magnitude of V- will be smaller than V+ on these older designs.

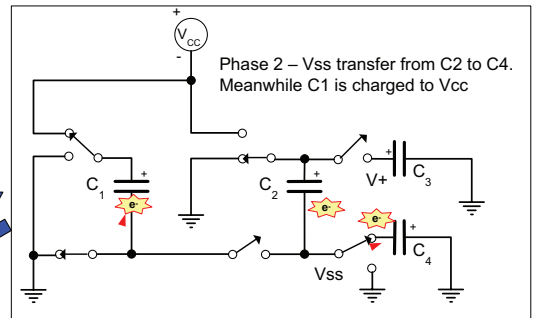

Under lightly loaded conditions the intelligent pump oscillator maximizes efficiency by running only as needed to maintain V+ and V-. Since interface transceivers often spend much of their time at idle this power-efficient innovation can greatly reduce total power consumption. This improvement is made possible by the independent phase sequence of the Exar charge pump design.

The clock rate for the charge pump typically operates at greater than 70kHz allowing the pump to run efficiently with small 0.1μF capacitors. Efficient operation depends on rapidly charging and discharging C1 and C2, therefore capacitors should be mounted close to the IC and have low ESR (equivalent series resistance). Inexpensive surface mount ceramic capacitors (such as

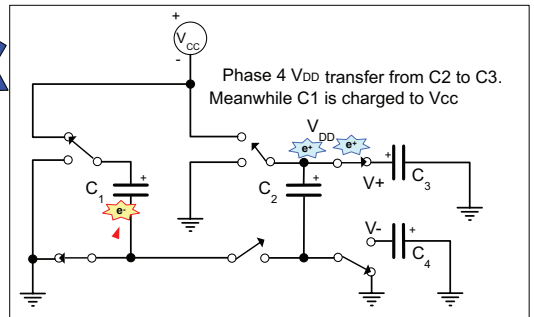

are widely used for power-supply decoupling) are ideal for use on the charge pump. The charge pumps are designed to be able to function properly with a wide range of capacitor styles and values. If polarized capacitors are used the positive and negative terminals should be connected as shown on the Typical Operating Circuit.

Capacitance values may be increased if operating at higher  $V_{CC}$  or to provide greater stability as the capacitors age.

The SP3224E-SP3227E devices have the advanced Auto On-Line<sup>®</sup> Plus feature RS-232 signals use both positive and negative voltages of greater than  $\pm 5V$  magnitude. Receivers have nominal  $5k\Omega$  impedance to ground. Even when idle, drivers will maintain output signal voltage creating a continuous current flow. In low power, battery operated devices this constant current drain can decrease battery life significantly.

Patented 5,306,954

Charge Pump Phases

Minimum Recommended Charge Pump Capacitor Values	
Input Voltage $V_{CC}$	Charge Pump Capacitor Value for SP32XX
3.0V to 3.6V	C1-C4=0.1 $\mu$ F
4.5V to 5.5V	C1=0.047 $\mu$ F, C2-C4=0.33 $\mu$ F
3.0V to 5.5V	C1-C4=0.22 $\mu$ F

Charge Pump Capacitor Values

that saves power by turning off the charge pumps and driver outputs when the transceiver inputs are idle for more than 30 seconds. Auto On-line® Plus is equivalent to Maxim's "Auto Shutdown Plus" feature. It differs from our existing Auto On-line® by relying on signal transitions rather than voltage levels to trigger shutdown and wakeup.

Auto On-Line® Plus automatically puts the device into a standby mode where it draws only 1µA typical. When the device detects activity on either the receiver or driver inputs it will automatically awake and activate to allow serial communication. Both the wakeup and shutdown happen automati-

Figure 3a. STATUS Functional Diagram, STATUS low

Figure 3b. STATUS Functional Diagram, STATUS high.

cally, without any user intervention, special drivers, or software modifications.

Wakeup and shutdown can be externally controlled by the ONLINE and SHUTDOWN pins. When ONLINE is driven to logic LOW, the Auto On-line® Plus function is active. Driving SHUTDOWN to

logic LOW forces the device into shutdown state regardless of input activity or the status of the ONLINE pin.

The STATUS output determines whether a valid RS-232 signal voltage is present on the inputs. The STATUS pin goes to a logic LOW when the receiver input signal levels collapse near reference ground. This may occur when the RS-232 cable is disconnected or the RS-232 drivers of the connected peripheral are turned off.

STATUS may be used to indicate DTR or a Ring Indicator signal or to determine whether a live RS232 driver or cable is connected. By connecting the STATUS output to ONLINE input, the SP3224E-SP3227E will shut down when no valid signal level and no input transitions are detected, and wake up on a valid signal level or signal edge. If it detects no signal transitions with the past 30

Figure 3c. Auto On-line Plus Logic

Figure 3d. Powerdown Logic

seconds, the device will go into low power mode. By connecting the STATUS output to both the ONLINE input and SHUTDOWN input pins, the device enters into shutdown when not receiving a valid RS-232 signal voltage input.

When the SP3224E-SP3227E devices are

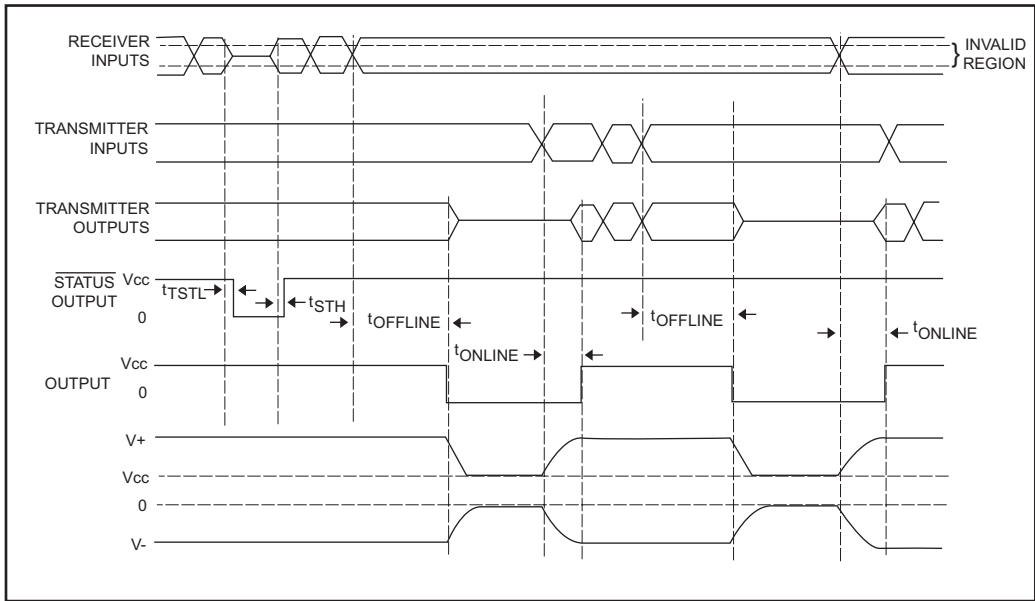

shut down, the charge pumps are turned off. V+ charge pump output decays to VCC, the V- output decays to GND. The decay time will depend on the size of capacitors used for the charge pump. Once in shutdown, the time required to exit the shutdown state and have valid V+ and V- levels is typically 50µs. When the SP3224E-SP3227E drivers and internal charge pump are disabled, the supply current is reduced to 1µA.

Auto On-Line (existing)	Device enters low-power mode if receiver inputs see less than valid +/- 3V.
	STATUS (or INVALID) signal output indicates if valid signal voltage is at receivers.
Auto On-Line Plus (new)	Device enters low-power mode if driver inputs or receiver inputs see no transitions for 30 seconds. Return to full power mode upon any transition on any driver input or receiver input
	Shutdown occurs even if data cable is connected to an active driver, as long as all inputs remain unchanged
	STATUS (or INVALID) signal functions as before. Indicates if valid signal voltage is present. But has no effect on shutdown
	For SP3224E the $\overline{\text{EN}}$ input is replaced with a READY output. READY drives high when charge pump achieves greater than -4V Vss (V-). Indicates "ready to transmit."

Comparison of Auto On-line<sup>®</sup> Features

		EXAR CORPORATION	
Packaging Approval:	16 PIN TSSOP PACKAGE OUTLINE	Drawing No:	16-PIN TSSOP
By: JL	Date: 11/21/07	Revision: C	Sheet: 1 OF 1

Part number	Temperature range	Package Type
SP3224ECA-L	From 0°C to +70°C	Lead Free 20 pin SSOP
SP3224ECY-L	From 0°C to +70°C	Lead Free 20 pin TSSOP
SP3224EEA-L	From -40°C to +85°C	Lead Free 20 pin SSOP
SP3224EEY-L	From -40°C to +85°C	Lead Free 20 pin TSSOP
SP3225ECA-L	From 0°C to +70°C	Lead Free 20 pin SSOP
SP3225ECY-L	From 0°C to +70°C	Lead Free 20 pin TSSOP
SP3225EEA-L	From -40°C to +85°C	Lead Free 20 pin SSOP
SP3225EEY-L	From -40°C to +85°C	Lead Free 20 pin TSSOP
SP3226ECA-L	From 0°C to +70°C	Lead Free 16 pin SSOP
SP3226ECY-L	From 0°C to +70°C	Lead Free 16 PIN SSOP
SP3226EEA-L	From -40°C to +85°C	Lead Free 16 pin SSOP
SP3226EEY-L	From -40°C to +85°C	Lead Free 16 PIN TSSOP
SP3227ECA-L	From 0°C to +70°C	Lead Free 16 PIN SSOP
SP3227ECY-L	From 0°C to +70°C	Lead Free 16 PIN TSSOP
SP3227EEA-L	From -40°C to +85°C	Lead Free 16 PIN SSOP
SP3227EEY-L	From -40°C to +85°C	Lead Free 16 PIN TSSOP

Available in Tape on Reel

DATE	REVISION	DESCRIPTION
11-20-06	P	Legacy Sipex Datasheet
12-14-09	1.0.0	Update to Exar Format. Change revision to 1.0.0. Change Supply Current Active over full Vcc range maximum from 2.0mA to 3.0mA. Change Supply Current Active at Vcc = 3.3V maximum from 1.0mA to 2.0mA. Change RX input voltage ABS Maximum Rating from +/-18V to +/-16V.
08-17-11	1.0.1	Correct type error on front page Features list.

#### Notice

EXAR Corporation reserves the right to make changes to any products contained in this publication in order to improve design, performance or reliability. EXAR Corporation assumes no representation that the circuits are free of patent infringement. Charts and schedules contained herein are only for illustration purposes and may vary depending upon a user's specific application. While the information in this publication has been carefully checked; no responsibility, however, is assumed for inaccuracies.

EXAR Corporation does not recommend the use of any of its products in life support applications where the failure or malfunction of the product can reasonably be expected to cause failure of the life support system or to significantly affect its safety or effectiveness. Products are not authorized for use in such applications unless EXAR Corporation receives, in writing, assurances to its satisfaction that: (a) the risk of injury or damage has been minimized; (b) the user assumes all such risks; (c) potential liability of EXAR Corporation is adequately protected under the circumstances.
