Note: 1. The device is functionally good at Vs = 5V. a step down, on Vs, to 4V does't reset the device.

2. BASS and TREBLE response: The center frequency and the response quality can be chosen by the external circuitry.

Figure 4. P.C.Board (Referred to DIP20 package only)

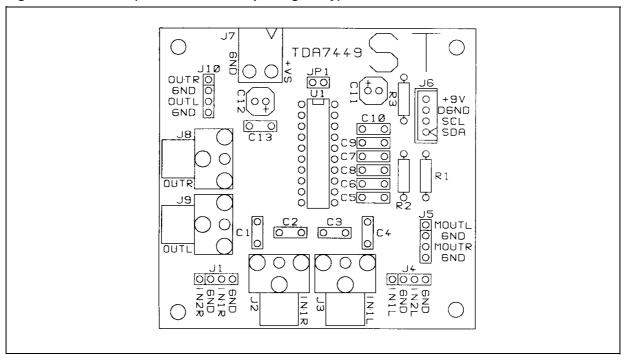

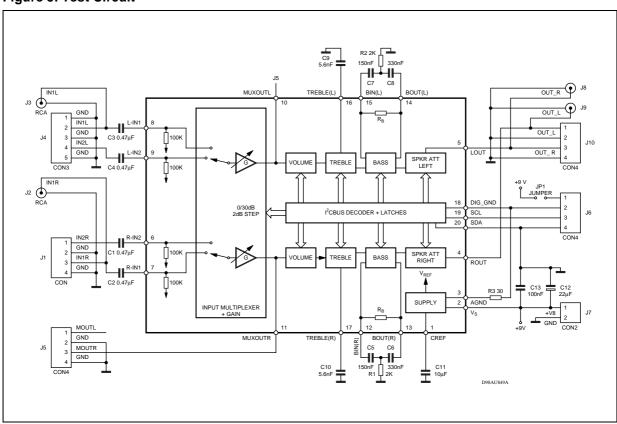

Figure 5. Test Circuit

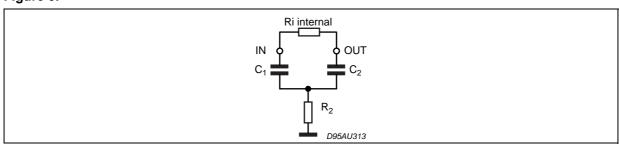

3 APLICATION SUGGESTIONS

The first and the last stages are volume control blocks. The control range is 0 to -47dB (mute) for the first one, 0 to -79dB (mute) for the last one. Both of them have 1dB step resolution. The very high resolution allows the implementation of systems free from any noisy acoustical effect. The TDA7449 audioprocessor provides 2 bands tones control.

3.1 Bass, Stages

The Bass cell has an internal resistor $Ri = 25K\Omega$ typical. Several filter types can be implemented, connecting external components to the Bass IN and OUT pins. The fig.6 refers to basic T Type Bandpass Filter starting from the filter component values (R1 internal Fc, the gain Av at max. boost and the filter Q factor are computed as follows:

Figure 6.

$$F_{C} = \frac{1}{2 \cdot \pi \cdot \sqrt{R1 \cdot R2 \cdot C1 \cdot C2}}$$

$$A_{V} = \frac{R2C2 + R2C1 + RiC1}{R2C1 + R2C2}$$

$$Q = \frac{\sqrt{R1 \cdot R2 \cdot C1 \cdot C2}}{R2C1 + R2C2}$$

Viceversa, once Fc, Av, and Ri internal value are fixed, the external components values will be:

$$C1 = \frac{A_V - 1}{2 \cdot \pi \cdot Fc \cdot Ri \cdot Q}$$

$$C2 = \frac{Q^2 \cdot C1}{A_V - 1 - Q^2}$$

$$R2 = \frac{A_V - 1 - Q^2}{2 \cdot \pi \cdot C1 \cdot Fc \cdot (A_V - 1) \cdot Q}$$

3.2 Treble Stage

The treble stage is a high pass filter whose time constant is fixed by an internal resistor ($25K\Omega$ typical) and an external capacitor connected between treble pins and ground Typical responses are reported in Figg. 10 to 13.

3.3 CREF

The suggested $10\mu F$ reference capacitor (CREF) value can be reduced to $4.7\mu F$ if the application requires faster power ON.

4 I²C BUS INTERFACE

Data transmission from microprocessor to the TDA7449 and vice versa takes place through the 2 wires I²C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

4.1 Data Validity

As shown in fig. 12, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

4.2 Start and Stop Conditions

As shown in fig.13 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

4.3 Byte Format

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

4.4 Acknowledge

The master (μ P) puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 14). The peripheral (audio processor) that acknowledges has to pull-down (LOW) the SDA line during this clock pulse.

The audio processor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

4.5 Transmission without Acknowledge

Avoiding to detect the acknowledge of the audio processor, the μP can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking.

Figure 12. Data Validity on the I²CBUS

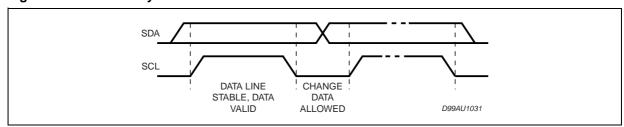

Figure 13. Timing Diagram of I²CBUS

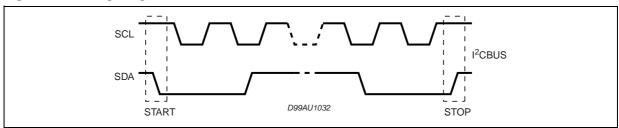

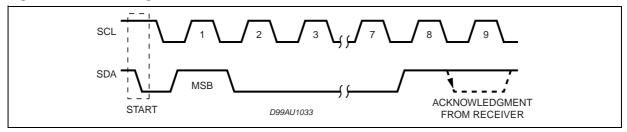

Figure 14. Acknowledge on the I²CBUS

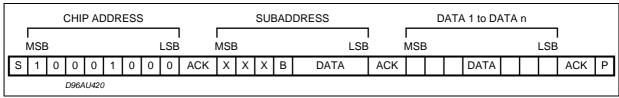

5 SOFTWARE SPECIFICATION

5.1 Interface Protocol

The interface protocol comprises:

- A start condition (S)
- A chip address byte, containing the TDA7449 address
- A subaddress bytes
- A sequence of data (N byte + acknowledge)
- A stop condition (P)

Figure 15.

ACK = Acknowledge

S = Start

P = Stop

A = Address

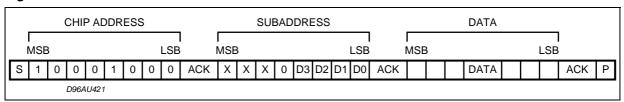

B = Auto Increment

6 EXAMPLES

6.1 No Incremental Bus

The TDA7449 receives a start condition, the correct chip address, a subaddress with the B = 0 (no incremental bus), N-data (all these data concern the subaddress selected), a stop condition.

Figure 16.

6.2 Incremental Bus

The TDA7449 receive a start conditions, the correct chip address, a subaddress with the B = 1 incremental bus): now it is in a loop condition with an autoincrease of the subaddress whereas SUBADDRESS from "XXX1000" to "XXX1111" of DATA are ignored.

The DATA 1 concern the subaddress sent, and the DATA 2 concern the subaddress sent plus one in the loop etc, and at the end it receivers the stop condition.
