# 1 Absolute maximum ratings and operating conditions

**Table 1. Absolute maximum ratings (AMR)**

| Symbol     | Parameter  | Value              | Unit |
|------------|--|--------------------|------|
| $V_{CC}$   | Supply voltage <sup>(1)</sup>  | 6                  | V    |
| $V_{in}$   | Input voltage <sup>(2)</sup>   | GND to $V_{CC}$    | V    |
| $T_{oper}$ | Operating free-air temperature range   | -40 to + 85        | °C   |
| $T_{stg}$  | Storage temperature  | -65 to +150        | °C   |
| $T_j$      | Maximum junction temperature   | 150                | °C   |
| $R_{thja}$ | Thermal resistance junction to ambient<br>Flip-chip <sup>(3)</sup><br>MiniSO-8<br>DFN8 | 250<br>215<br>120  | °C/W |
| $P_{diss}$ | Power dissipation  | Internally limited |      |
| ESD        | HBM: Human body model <sup>(4)</sup>   | 2                  | kV   |
|            | MM: Machine model <sup>(5)</sup>   | 200                | V    |
|            | Latch-up immunity  | 200                | mA   |
|            | Lead temperature (soldering, 10sec)  | 250                | °C   |
|            | Lead temperature (soldering, 10sec) for lead-free version                              | 260                |      |

1. All voltage values are measured with respect to the ground pin.
2. The magnitude of the input signal must never exceed  $V_{CC} + 0.3\text{ V}$  / GND - 0.3 V.
3. The device is protected in case of over temperature by a thermal shutdown active at 150° C.
4. Human body model: A 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
5. Machine model: A 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.

**Table 2. Operating conditions**

| Symbol     | Parameter   | Value  | Unit |
|------------|---|--|------|
| $V_{CC}$   | Supply voltage  | 2.2 to 5.5   | V    |
| $V_{icm}$  | Common mode input voltage range   | 1.2V to $V_{CC}$   | V    |
| $V_{STBY}$ | Standby voltage input:<br>Device ON<br>Device OFF   | $1.35 \leq V_{STBY} \leq V_{CC}$<br>$GND \leq V_{STBY} \leq 0.4$ | V    |
| $R_L$      | Load resistor   | $\geq 4$   | Ω    |
| $T_{SD}$   | Thermal shutdown temperature  | 150  | °C   |
| $R_{thja}$ | Thermal resistance junction to ambient<br>Flip-chip <sup>(1)</sup><br>MiniSO-8<br>DFN8 <sup>(2)</sup> | 100<br>190<br>40   | °C/W |

1. This thermal resistance is reached with a 100 mm<sup>2</sup> copper heatsink surface.
2. When mounted on a 4-layer PCB.

# 2 Typical application schematics

Figure 1. Typical application schematics

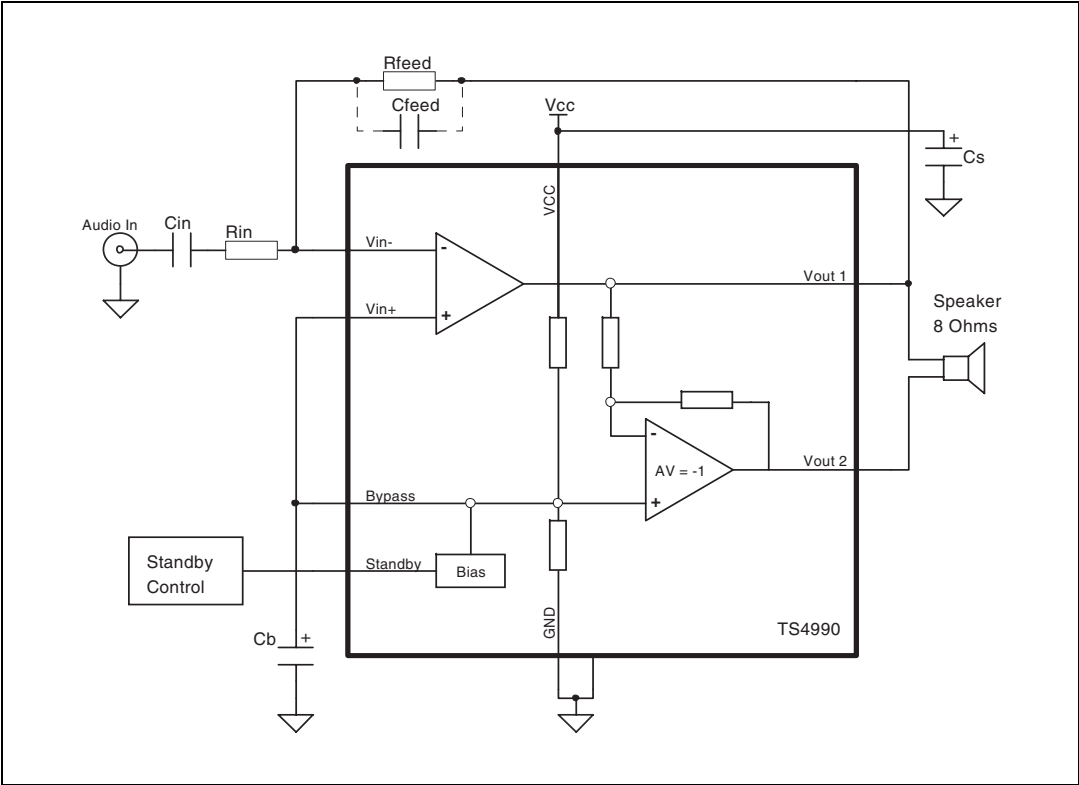

Table 3. Component descriptions

| Component   | Functional description   |
|-------------|--|
| $R_{in}$    | Inverting input resistor that sets the closed loop gain in conjunction with $R_{feed}$ . This resistor also forms a high pass filter with $C_{in}$ ( $F_c = 1 / (2 \times \pi \times R_{in} \times C_{in})$ ). |
| $C_{in}$    | Input coupling capacitor that blocks the DC voltage at the amplifier input terminal.   |
| $R_{feed}$  | Feed back resistor that sets the closed loop gain in conjunction with $R_{in}$ .   |
| $C_s$       | Supply bypass capacitor that provides power supply filtering.  |
| $C_b$       | Bypass pin capacitor that provides half supply filtering.  |
| $C_{feed}$  | Low pass filter capacitor allowing to cut the high frequency (low pass filter cut-off frequency $1 / (2 \times \pi \times R_{feed} \times C_{feed})$ ).  |
| $A_v$       | Closed loop gain in BTL configuration = $2 \times (R_{feed} / R_{in})$ .   |
| Exposed pad | DFN8 exposed pad is electrically connected to pin 7. See <a href="#">DFN8 package information on page 29</a> for more information.   |

### 3 Electrical characteristics

**Table 4. Electrical characteristics when  $V_{CC} = +5\text{ V}$ ,  $GND = 0\text{ V}$ ,  $T_{amb} = 25^\circ\text{C}$  (unless otherwise specified)**

| Symbol        | Parameter  | Min.     | Typ.     | Max. | Unit          |
|---------------|--|----------|----------|------|---------------|

## 4 Application information

### 4.1 BTL configuration principle

The TS4990 is a monolithic power amplifier with a BTL output type. BTL (bridge tied load) means that each end of the load is connected to two single-ended output amplifiers. Thus, we have:

$$\begin{aligned}\text{Single-ended output 1} &= V_{\text{out1}} = V_{\text{out}} \text{ (V)} \\ \text{Single-ended output 2} &= V_{\text{out2}} = -V_{\text{out}} \text{ (V)} \\ \text{and } V_{\text{out1}} - V_{\text{out2}} &= 2V_{\text{out}} \text{ (V)}\end{aligned}$$

The output power is:

$$P_{\text{out}} = \frac{(2V_{\text{outRMS}})^2}{R_L}$$

For the same power supply voltage, the output power in BTL configuration is four times higher than the output power in single-ended configuration.

### 4.2 Gain in a typical application

The typical application schematics are shown in [Figure 1 on page 4](#).

In the flat region (no  $C_{\text{in}}$  effect), the output voltage of the first stage is (in Volts):

$$V_{\text{out1}} = (-V_{\text{in}}) \frac{R_{\text{feed}}}{R_{\text{in}}}$$

For the second stage:  $V_{\text{out2}} = -V_{\text{out1}}$  (V)

The differential output voltage is (in Volts):

$$V_{\text{out2}} - V_{\text{out1}} = 2V_{\text{in}} \frac{R_{\text{feed}}}{R_{\text{in}}}$$

The differential gain named gain ( $G_v$ ) for more convenience is:

$$G_v = \frac{V_{\text{out2}} - V_{\text{out1}}}{V_{\text{in}}} = 2 \frac{R_{\text{feed}}}{R_{\text{in}}}$$

$V_{\text{out2}}$  is in phase with  $V_{\text{in}}$  and  $V_{\text{out1}}$  is phased  $180^\circ$  with  $V_{\text{in}}$ . This means that the positive terminal of the loudspeaker should be connected to  $V_{\text{out2}}$  and the negative to  $V_{\text{out1}}$ .

### 4.3 Low and high frequency response

In the low frequency region,  $C_{\text{in}}$  starts to have an effect.  $C_{\text{in}}$  forms with  $R_{\text{in}}$  a high-pass filter with a -3 dB cut-off frequency.  $F_{\text{CL}}$  is in Hz.

$$F_{\text{CL}} = \frac{1}{2\pi R_{\text{in}} C_{\text{in}}}$$

In the high frequency region, you can limit the bandwidth by adding a capacitor ( $C_{\text{feed}}$ ) in parallel with  $R_{\text{feed}}$ . It forms a low-pass filter with a -3 dB cut-off frequency.  $F_{\text{CH}}$  is in Hz.

$$F_{\text{CH}} = \frac{1}{2\pi R_{\text{feed}} C_{\text{feed}}}$$

The graph in [Figure 60](#) shows an example of  $C_{in}$  and  $C_{feed}$  influence.

**Figure 60. Frequency response gain vs.  $C_{in}$  and  $C_{feed}$**

## 4.4 Power dissipation and efficiency

### Hypotheses:

- Load voltage and current are sinusoidal ( $V_{out}$  and  $I_{out}$ ).
- Supply voltage is a pure DC source ( $V_{CC}$ ).

The load can be expressed as:

$$V_{out} = V_{PEAK} \sin \omega t \quad (V)$$

and

$$I_{out} = \frac{V_{out}}{R_L} \quad (A)$$

and

$$P_{out} = \frac{V_{PEAK}^2}{2R_L} \quad (W)$$

Therefore, the average current delivered by the supply voltage is:

$$I_{CC_{AVG}} = 2 \frac{V_{PEAK}}{\pi R_L} \quad (A)$$

The power delivered by the supply voltage is:

$$P_{supply} = V_{CC} \cdot I_{CC_{AVG}} \quad (W)$$

Therefore, the **power dissipated by each amplifier** is:

$$P_{\text{diss}} = P_{\text{supply}} - P_{\text{out}} \text{ (W)}$$

$$P_{\text{diss}} = \frac{2\sqrt{2}V_{\text{CC}}}{\pi\sqrt{R_L}} \sqrt{P_{\text{out}}} - P_{\text{out}}$$

and the maximum value is obtained when:

$$\frac{\delta P_{\text{diss}}}{\delta P_{\text{out}}} = 0$$

and its value is:

$$P_{\text{diss}_{\text{max}}} = \frac{2V_{\text{CC}}^2}{\pi^2 R_L} \text{ (W)}$$

*Note: This maximum value is only dependent on power supply voltage and load values.*

The **efficiency** is the ratio between the output power and the power supply:

$$\eta = \frac{P_{\text{out}}}{P_{\text{supply}}} = \frac{\pi V_{\text{PEAK}}}{4V_{\text{CC}}}$$

The maximum theoretical value is reached when  $V_{\text{PEAK}} = V_{\text{CC}}$ , so:

$$\frac{\pi}{4} = 78.5\%$$

## 4.5 Decoupling of the circuit

Two capacitors are needed to correctly bypass the TS4990: a power supply bypass capacitor  $C_s$  and a bias voltage bypass capacitor  $C_b$ .

$C_s$  has particular influence on the THD+N in the high frequency region (above 7 kHz) and an indirect influence on power supply disturbances. With a value for  $C_s$  of 1  $\mu\text{F}$ , you can expect THD+N levels similar to those shown in the datasheet.

In the high frequency region, if  $C_s$  is lower than 1  $\mu\text{F}$ , it increases THD+N and disturbances on the power supply rail are less filtered.

On the other hand, if  $C_s$  is higher than 1  $\mu\text{F}$ , those disturbances on the power supply rail are more filtered.

$C_b$  has an influence on THD+N at lower frequencies, but its function is critical to the final result of PSRR (with input grounded and in the lower frequency region).

If  $C_b$  is lower than 1  $\mu\text{F}$ , THD+N increases at lower frequencies and PSRR worsens.

If  $C_b$  is higher than 1  $\mu\text{F}$ , the benefit on THD+N at lower frequencies is small, but the benefit to PSRR is substantial.

Note that  $C_{\text{in}}$  has a non-negligible effect on PSRR at lower frequencies. The lower the value of  $C_{\text{in}}$ , the higher the PSRR.

## 4.6 Wake-up time ( $t_{WU}$ )

When the standby is released to put the device ON, the bypass capacitor  $C_b$  is not charged immediately. Because  $C_b$  is directly linked to the bias of the amplifier, the bias will not work properly until the  $C_b$  voltage is correct. The time to reach this voltage is called wake-up time or  $t_{WU}$  and specified in the electrical characteristics tables with  $C_b = 1 \mu\text{F}$ .

If  $C_b$  has a value other than  $1 \mu\text{F}$ , refer to the graph in [Figure 61](#) to establish the wake-up time.

**Figure 61. Typical wake-up time vs.  $C_b$**

Due to process tolerances, the maximum value of wake-up time is shown in [Figure 62](#).

**Figure 62. Maximum wake-up time vs.  $C_b$**

**Note:** The bypass capacitor  $C_b$  also has a typical tolerance of  $\pm 20\%$ . To calculate the wake-up time with this tolerance, refer to the graph above (considering for example for  $C_b = 1 \mu\text{F}$  in the range of  $0.8 \mu\text{F} \leq C_b \leq 1.2 \mu\text{F}$ ).

## 4.7 Standby time

When the standby command is set, the time required to put the two output stages in high impedance and the internal circuitry in standby mode is a few microseconds. In standby

mode, the bypass pin and  $V_{in}$  pin are short-circuited to ground by internal switches. This allows a quick discharge of  $C_b$  and  $C_{in}$  capacitors.

## 4.8 Pop performance

Pop performance is intimately linked with the size of the input capacitor  $C_{in}$  and the bias voltage bypass capacitor  $C_b$ .

The size of  $C_{in}$  is dependent on the lower cut-off frequency and PSRR values requested. The size of  $C_b$  is dependent on THD+N and PSRR values requested at lower frequencies.

Moreover,  $C_b$  determines the speed with which the amplifier turns ON. In order to reach near zero pop and click, the equivalent input constant time,

$$\tau_{in} = (R_{in} + 2k\Omega) \times C_{in} \text{ (s) with } R_{in} \geq 5k\Omega$$

must not reach the  $\tau_{in}$  maximum value as indicated in [Figure 63](#) below.

**Figure 63.  $\tau_{in}$  max. versus bypass capacitor**

By following the previous rules, the TS4990 can reach near zero pop and click even with high gains such as 20 dB.

### Example:

With  $R_{in} = 22 k\Omega$  and a 20 Hz, -3 dB low cut-off frequency,  $C_{in} = 361 \text{ nF}$ . So,  $C_{in} = 390 \text{ nF}$  with standard value which gives a lower cut-off frequency equal to 18.5 Hz. In this case,  $(R_{in} + 2k\Omega) \times C_{in} = 9.36 \text{ ms}$ . By referring to the previous graph, if  $C_b = 1 \mu F$  and  $V_{CC} = 5 V$ , we read 20 ms max. This value is twice as high as our current value, thus we can state that pop and click will be reduced to its lowest value.

Minimizing both  $C_{in}$  and the gain benefits both the pop phenomenon, and the cost and size of the application.

## 4.9 Application example: differential input, BTL power amplifier

The schematics in [Figure 64](#) show how to configure the TS4990 to work in differential input mode. The gain of the amplifier is:

$$G_{VDIFF} = 2 \frac{R_2}{R_1}$$

In order to reach the best performance of the differential function,  $R_1$  and  $R_2$  should be matched at 1% max.

**Figure 64. Differential input amplifier configuration**

The input capacitor  $C_{in}$  can be calculated by the following formula using the -3 dB lower frequency required. ( $F_L$  is the lower frequency required).

$$C_{in} \approx \frac{1}{2\pi R_1 F_L} \quad (F)$$

**Note:** This formula is true only if:

$$F_{CB} = \frac{1}{2\pi(R_1 + R_2)C_B} \quad (Hz)$$

is 5 times lower than  $F_L$ .

**Example bill of materials**

The bill of materials in [Table 7](#) is for the example of a differential amplifier with a gain of 2 and a -3 dB lower cut-off frequency of about 80 Hz.

**Table 7. Bill of materials for differential input amplifier application**

| Pin name  | Functional description |
|-----------|------------------------|
| $R_1$     | 20k / 1%               |
| $R_2$     | 20k / 1%               |
| $C_{in}$  | 100 nF                 |
| $C_b=C_s$ | 1 $\mu$ F              |
| U1        | TS4990                 |

## 5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK® is an ST trademark.

### 5.1 Flip-chip package information

Figure 65. Flip-chip pinout (top view)

Figure 66. Marking (top view)

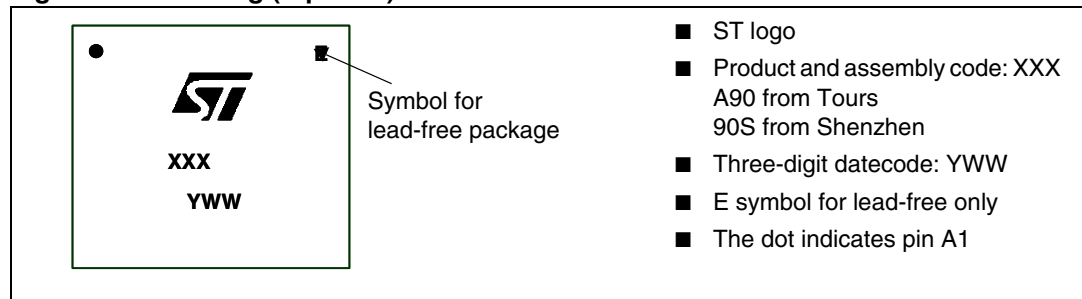

Figure 67. Package mechanical data for 9-bump flip-chip package

Figure 68. Daisy chain mechanical data

The daisy chain sample features two-by-two pin connections. The schematics in [Figure 68](#) illustrate the way pins connect to each other. This sample is used to test continuity on your board. Your PCB needs to be designed the opposite way, so that pins that are unconnected in the daisy chain sample, are connected on your PCB. If you do this, by simply connecting an Ohmmeter between pin A1 and pin A3, the soldering process continuity can be tested.

Figure 69. TS4990 footprint recommendations

Figure 70. Tape and reel specification (top view)

### Device orientation

The devices are oriented in the carrier pocket with pin number A1 adjacent to the sprocket holes.

### 5.3 DFN8 package information

**Note:** DFN8 exposed pad (E2 x D2) is connected to pin number 7. For enhanced thermal performance, the exposed pad must be soldered to a copper area on the PCB, acting as a heatsink. This copper area can be electrically connected to pin7 or left floating.

**Figure 72. DFN8 3x3x0.90mm package mechanical drawing (pitch 0.5mm)**

**Table 9. DFN8 3x3x0.90mm package mechanical data (pitch 0.5mm)**

## 7 Revision history

**Table 12. Document revision history**

| Date        | Revision | Changes   |
|-------------|----------|---|
| 1-Jul-2002  | 1        | First release.  |
| 4-Sep-2003  | 2        | Update mechanical data.   |
| 1-Oct-2004  | 3        | Order code for back coating on flip-chip.   |
| 2-Apr-2005  | 4        | Typography error on page 1: Mini-SO-8 pin connection.   |
| May-2005    | 5        | New marking for assembly code plant.  |
| 1-Jul-2005  | 6        | Error on <a href="#">Table 4 on page 5</a> . Parameters in wrong column.  |
| 28-Sep-2005 | 7        | Updated mechanical coplanarity data to 50µm (instead of 60µm) (see <a href="#">Figure 67 on page 25</a> ).  |
| 14-Mar-2006 | 8        | SO-8 package inserted in the datasheet.   |
| 21-Jul-2006 | 9        | Update of <a href="#">Figure 66 on page 25</a> . Disclaimer update.   |
| 11-May-2007 | 10       | Corrected value of PSRR in <a href="#">Table 5 on page 6</a> from 1 to 61 (typical value).<br>Moved <a href="#">Table 3: Component descriptions</a> to <a href="#">Section 2: Typical application schematics on page 4</a> .<br>Merged daisy chain flip-chip order code table into <a href="#">Table 11: Order codes on page 31</a> .                                   |
| 17-Jan-2008 | 11       | Corrected pitch error in DFN8 package information. Actual pitch is 0.5mm. Updated DFN8 package dimensions to correspond to JEDEC databook definition (in previous versions of datasheet, package dimensions were as in manufacturer's drawing).<br>Corrected error in MiniSO-8 package information (L and L1 values were inverted).<br>Reformatted package information. |
| 21-May-2008 | 12       | Corrected value of output resistance vs. ground in standby mode: removed from <a href="#">Table 2</a> , and added in <a href="#">Table 4</a> , <a href="#">Table 5</a> , and <a href="#">Table 6</a> .  |
| 30-Aug-2011 | 13       | Updated DFN8 package ( <a href="#">Figure 72</a> )<br>Updated ECOPACK® text in <a href="#">Section 5: Package information</a>   |
