Notes:

1. Tested with the load in Figure 1.
2. Tested with the load in Figure 2. Transition is measured ± 500 mV from steady-state voltage. t_{HZOE}, t_{HZCS}, t_{HZB}, and t_{HZWE} transitions are measured when the output enters a high impedance state. Not 100% tested.
3. The internal write time is defined by the overlap of $\overline{CS1}$ =LOW, CS2=HIGH, (\overline{UB} or \overline{LB})=LOW, and \overline{WE} =LOW. All four conditions must be in valid states to initiate a Write, but any condition can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the write.
4. t_{PWE} > t_{HZWE} + t_{SD} when OE is LOW.
5. Address inputs must meet V_{IH} and V_{IL} SPEC during this period. Any glitch or unknown inputs are not permitted. Unknown input with standby mode is acceptable.
6. Data retention characteristics are defined later in DATA RETENTION CHARACTERISTICS.

TIMING DIAGRAM

READ CYCLE NO. 1^(1,2) (ADDRESS CONTROLLED) ($\overline{CS1}=\overline{OE}=V_{IL}$, $CS2=\overline{WE}=V_{IH}$)

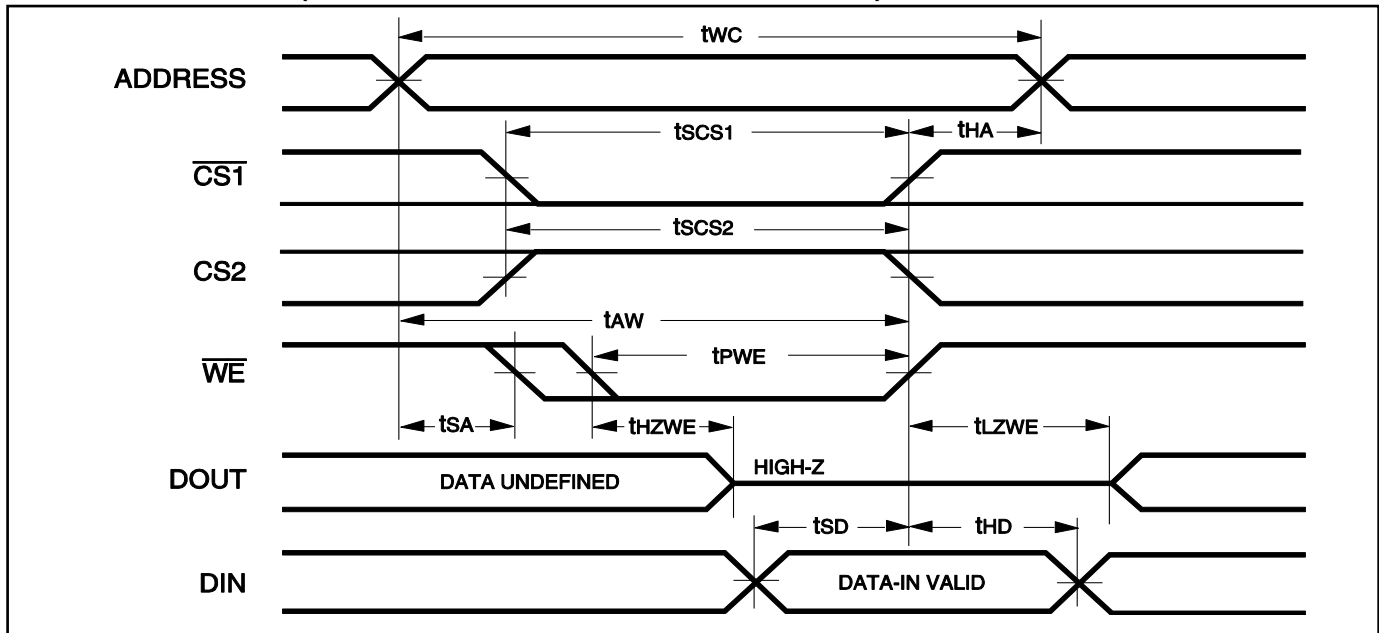

READ CYCLE NO. 2^(1,3) ($\overline{CS1}$, $CS2$, AND \overline{OE} CONTROLLED)

Notes:

1. \overline{WE} is HIGH for a Read Cycle.
2. The device is continuously selected. \overline{OE} , $\overline{CS1}=V_{IL}$. $CS2=\overline{WE}=V_{IH}$.
3. Address is valid prior to or coincident with $\overline{CS1}$ LOW and $CS2$ HIGH transition.

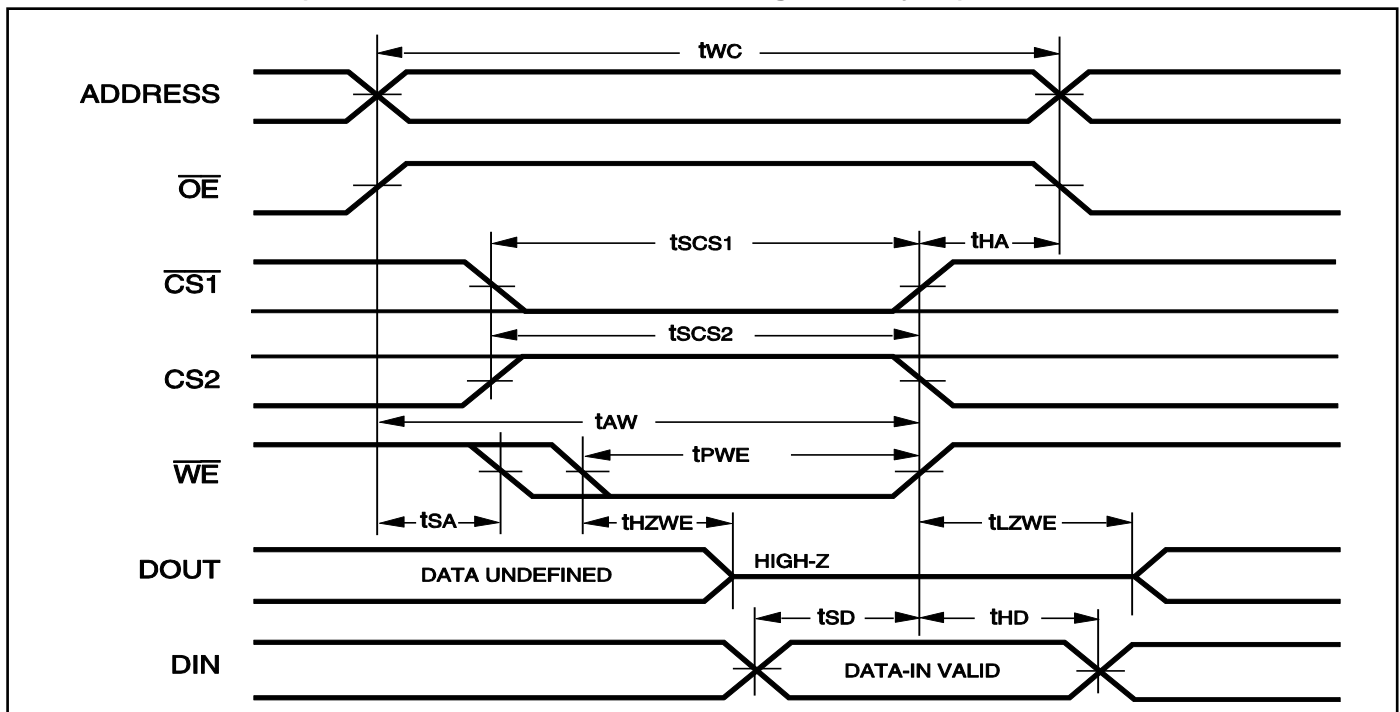

WRITE CYCLE NO. 1 ($\overline{CS1}$ CONTROLLED, \overline{OE} = HIGH OR LOW)

Notes:

1. tHZWE is based on the assumption when tSA=0nS after READ operation. Actual DOUT for tHZWE may not appear if \overline{OE} goes high before Write Cycle. tHZOE is the time DOUT goes to High-Z after \overline{OE} goes high.
2. During this period the I/Os are in output state. Do not apply input signals.

WRITE CYCLE NO. 2 (\overline{WE} Controlled: \overline{OE} is HIGH During Write Cycle)

Notes:

1. tHZWE is based on the assumption when tSA=0nS after READ operation. Actual DOUT for tHZWE may not appear if \overline{OE} goes high before Write Cycle. tHZOE is the time DOUT goes to High-Z after \overline{OE} goes high.
2. During this period the I/Os are in output state. Do not apply input signals.

WRITE CYCLE NO. 3 (\overline{WE} CONTROLLED: \overline{OE} IS LOW DURING WRITE CYCLE)

Notes:

If \overline{OE} is low during write cycle, t_{HZWE} must be met in the application. Do not apply input signal during this period. Data output from the previous READ operation will drive IO BUS.
