

### FEATURES AND BENEFITS (continued)

- Chopper stabilization results in extremely stable quiescent output voltage
- Nearly zero magnetic hysteresis
- Ratiometric output from supply voltage

### DESCRIPTION (continued)

The ACS722 is provided in a low profile surface mount SOIC16 package. The leadframe is plated with 100% matte tin, which is compatible with standard lead (Pb) free printed circuit board assembly processes. Internally, the device is Pb-free, except for flip-chip high-temperature Pb-based solder balls, currently exempt from RoHS. The device is fully calibrated prior to shipment from the factory.

### SELECTION GUIDE

Part Number	I <sub>PR</sub> (A)	Sens(Typ) at V <sub>CC</sub> = 3.3 V (mV/A)	T <sub>A</sub> (°C)	Packing [1]
ACS722KMATR-10AB-T	±10	132	-40 to 125	Tape and Reel, 3000 pieces per reel
ACS722KMATR-20AB-T	±20	66		
ACS722KMATR-40AB-T	±40	33		

[1] Contact Allegro for additional packing options.

## SPECIFICATIONS

## ABSOLUTE MAXIMUM RATINGS

Characteristic	Symbol	Notes	Rating	Units
Supply Voltage	$V_{CC}$		6	V
Reverse Supply Voltage	$V_{RCC}$		-0.1	V
Output Voltage	$V_{IOUT}$		25	V
Reverse Output Voltage	$V_{RIOUT}$		-0.1	V
Maximum Continuous Current	$I_{CMAX}$	$T_A = 25^{\circ}\text{C}$	60	A
Operating Ambient Temperature	$T_A$	Range K	-40 to 125	$^{\circ}\text{C}$
Junction Temperature	$T_J(\text{max})$		165	$^{\circ}\text{C}$
Storage Temperature	$T_{stg}$		-65 to 165	$^{\circ}\text{C}$

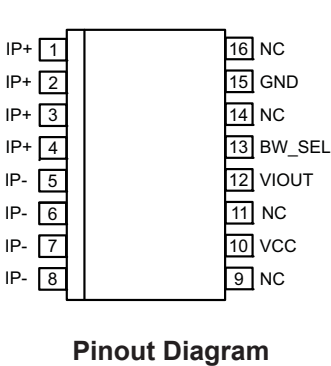

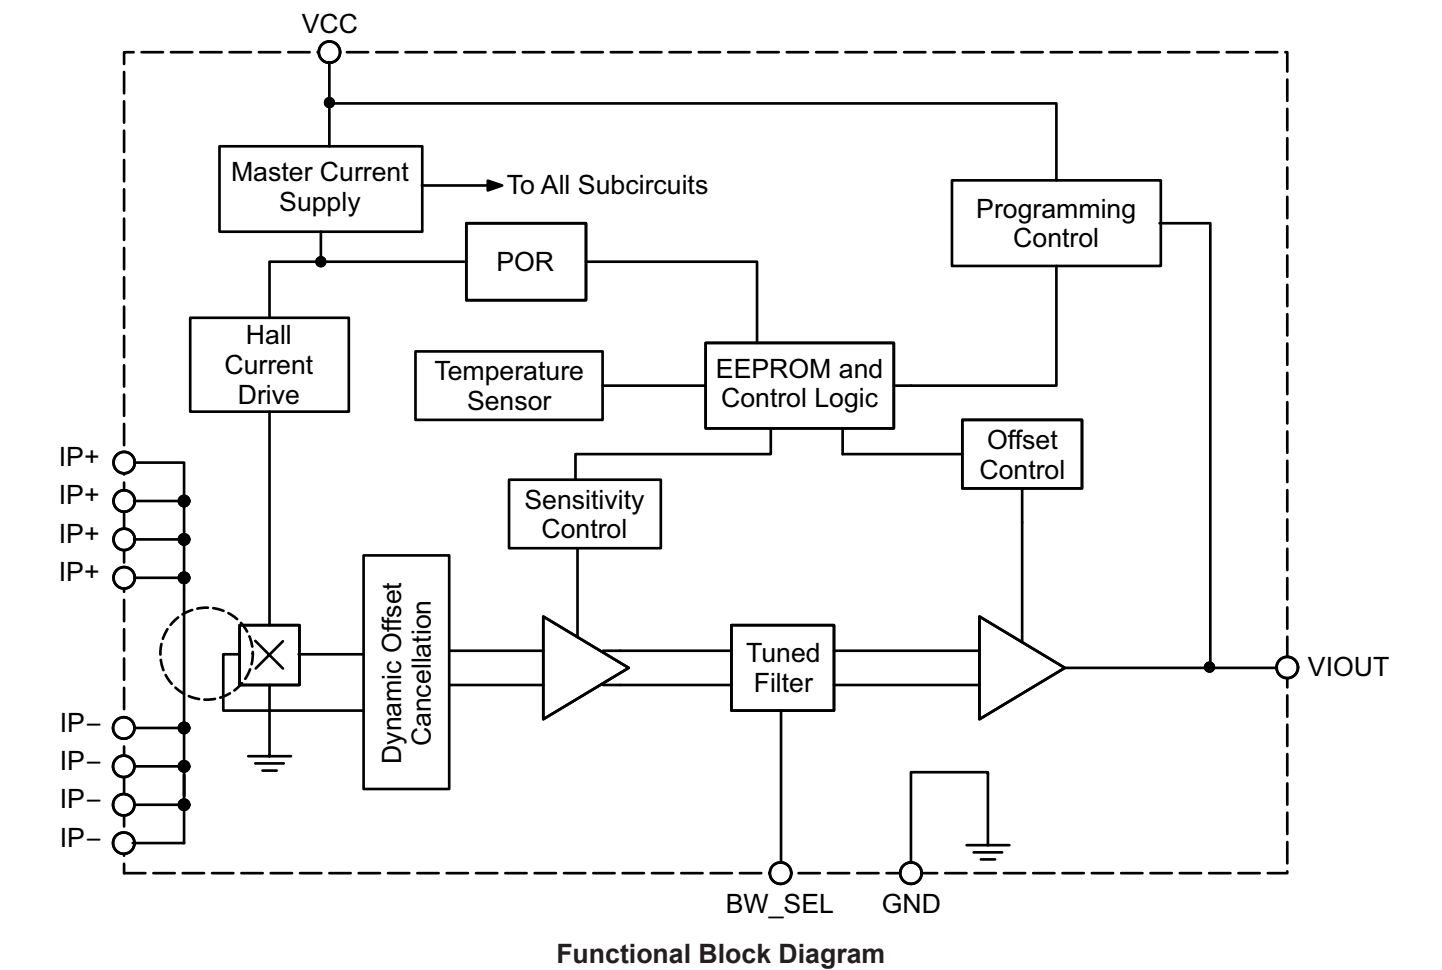

## ISOLATION CHARACTERISTICS

Characteristic	Symbol	Notes	Rating	Unit
Dielectric Strength Test Voltage	$V_{ISO}$	Agency type-tested for 60 seconds per UL 60950-1 (edition. 2). Production tested at 3000 $V_{RMS}$ for 1 second, in accordance with UL 60950-1 (edition. 2).	4800	$V_{RMS}$
Working Voltage for Basic Isolation	$V_{WVBI}$	Maximum approved working voltage for basic (single) isolation according UL 60950-1 (edition 2)	1550	$V_{PK}$
			1097	$V_{RMS}$ or VDC
Working Voltage for Reinforced Isolation	$V_{WVRI}$	Maximum approved working voltage for reinforced isolation according to UL 60950-1 (edition 2)	800	$V_{PK}$
			565	$V_{RMS}$ or VDC
Clearance	$D_{cl}$	Minimum distance through air from IP leads to signal leads.	7.5	mm
Creepage	$D_{cr}$	Minimum distance along package body from IP leads to signal leads	8.2	mm

## THERMAL CHARACTERISTICS

Characteristic	Symbol	Test Conditions*	Value	Units
Package Thermal Resistance (Junction to Ambient)	$R_{\theta JA}$	Mounted on the Allegro 85-0738 evaluation board with 700 mm <sup>2</sup> of 4 oz. copper on each side, connected to pins 1 and 2, and to pins 3 and 4, with thermal vias connecting the layers. Performance values include the power consumed by the PCB.	23	$^{\circ}\text{C}/\text{W}$
Package Thermal Resistance (Junction to Lead)	$R_{\theta JL}$	Mounted on the Allegro ASEK 722 evaluation board.	5	$^{\circ}\text{C}/\text{W}$

\*Additional thermal information available on the Allegro website.

Terminal List Table		
Number	Name	Description
1, 2, 3, 4	IP+	Terminals for current being sensed; fused internally
5, 6, 7, 8	IP-	Terminals for current being sensed; fused internally
9, 16	NC	No internal connection; recommended to be left unconnected in order to maintain high creepage.
10	VCC	Device power supply terminal
11, 14	NC	No internal connection; recommended to connect to GND for the best ESD performance
12	VIOUT	Analog output signal
13	BW_SEL	Terminal for selecting 20 kHz or 80 kHz bandwidth
15	GND	Signal ground terminal

**COMMON ELECTRICAL CHARACTERISTICS** [1]: Valid through the full range of  $T_A = -40^\circ\text{C}$  to  $125^\circ\text{C}$ ,  
and at  $V_{CC} = 3.3\text{ V}$ , unless otherwise specified

Characteristic	Symbol	Test Conditions	Min.	Typ.	Max.	Units
Supply Voltage	$V_{CC}$		3	3.3	3.6	V
Supply Current	$I_{CC}$	$V_{CC}$ within $V_{CC}(\text{min})$ and $V_{CC}(\text{max})$	–	9	12	mA
Output Capacitance Load	$C_L$	VIOUT to GND	–	–	10	nF
Output Resistive Load	$R_L$	VIOUT to GND	4.7	–	–	k $\Omega$
Primary Conductor Resistance	$R_{IP}$	$T_A = 25^\circ\text{C}$	–	0.85	–	m $\Omega$
Magnetic Coupling Factor	$C_F$		–	4.5	–	G/A
Rise Time	$t_r$	$I_P = I_P(\text{max})$ , $T_A = 25^\circ\text{C}$ , $C_L = 1\text{ nF}$ , BW_SEL tied to GND	–	4	–	$\mu\text{s}$
		$I_P = I_P(\text{max})$ , $T_A = 25^\circ\text{C}$ , $C_L = 1\text{ nF}$ , BW_SEL tied to VCC	–	17.5	–	$\mu\text{s}$
Propagation Delay	$t_{pd}$	$I_P = I_P(\text{max})$ , $T_A = 25^\circ\text{C}$ , $C_L = 1\text{ nF}$ , BW_SEL tied to GND	–	2	–	$\mu\text{s}$
		$I_P = I_P(\text{max})$ , $T_A = 25^\circ\text{C}$ , $C_L = 1\text{ nF}$ , BW_SEL tied to VCC	–	5	–	$\mu\text{s}$
Response Time	$t_{\text{RESPONSE}}$	$I_P = I_P(\text{max})$ , $T_A = 25^\circ\text{C}$ , $C_L = 1\text{ nF}$ , BW_SEL tied to GND	–	5	–	$\mu\text{s}$
		$I_P = I_P(\text{max})$ , $T_A = 25^\circ\text{C}$ , $C_L = 1\text{ nF}$ , BW_SEL tied to VCC	–	22.5	–	$\mu\text{s}$
Internal Bandwidth	BW <sub>i</sub>	Small signal –3 dB; $C_L = 1\text{ nF}$ , BW_SEL tied to GND	–	80	–	kHz
		Small signal –3 dB; $C_L = 1\text{ nF}$ , BW_SEL tied to VCC	–	20	–	kHz
Noise Density	$I_{ND}$	Input referenced noise density; $T_A = 25^\circ\text{C}$ , $C_L = 1\text{ nF}$	–	300	–	$\mu\text{A}_{(\text{rms})}/\sqrt{\text{Hz}}$
Noise	$I_N$	Input referenced noise; BW <sub>i</sub> = 80 kHz, $T_A = 25^\circ\text{C}$ , $C_L = 1\text{ nF}$	–	84	–	$\text{mA}_{(\text{rms})}$
		Input referenced noise; BW <sub>i</sub> = 20 kHz, $T_A = 25^\circ\text{C}$ , $C_L = 1\text{ nF}$	–	42	–	$\text{mA}_{(\text{rms})}$
Nonlinearity	$E_{\text{LIN}}$	Through full range of $I_P$	–	$\pm 1$	–	%
Saturation Voltage [2]	$V_{OH}$	$R_L = 4.7\text{ k}\Omega$ , $T_A = 25^\circ\text{C}$	$V_{CC} - 0.33$	–	–	V
	$V_{OL}$	$R_L = 4.7\text{ k}\Omega$ , $T_A = 25^\circ\text{C}$	–	–	0.33	V
Power-On Time	$t_{PO}$	Output reaches 90% of steady-state level, $T_A = 25^\circ\text{C}$ , $I_P = I_{PR}(\text{max})$ applied	–	64	–	$\mu\text{s}$

[1] Device may be operated at higher primary current levels,  $I_P$ , ambient temperatures,  $T_A$ , and internal leadframe temperatures, provided the Maximum Junction Temperature,  $T_J(\text{max})$ , is not exceeded.

[2] The sensor IC will continue to respond to current beyond the range of  $I_P$  until the high or low saturation voltage; however, the nonlinearity in this region will be worse than through the rest of the measurement range.

**xKMATR-10AB PERFORMANCE CHARACTERISTICS:**  $T_A$  Range K, valid at  $T_A = -40^\circ\text{C}$  to  $125^\circ\text{C}$ ,  $V_{CC} = 3.3\text{ V}$ , unless otherwise specified

### CHARACTERISTIC PERFORMANCE

#### xKMATR-10AB Key Parameters

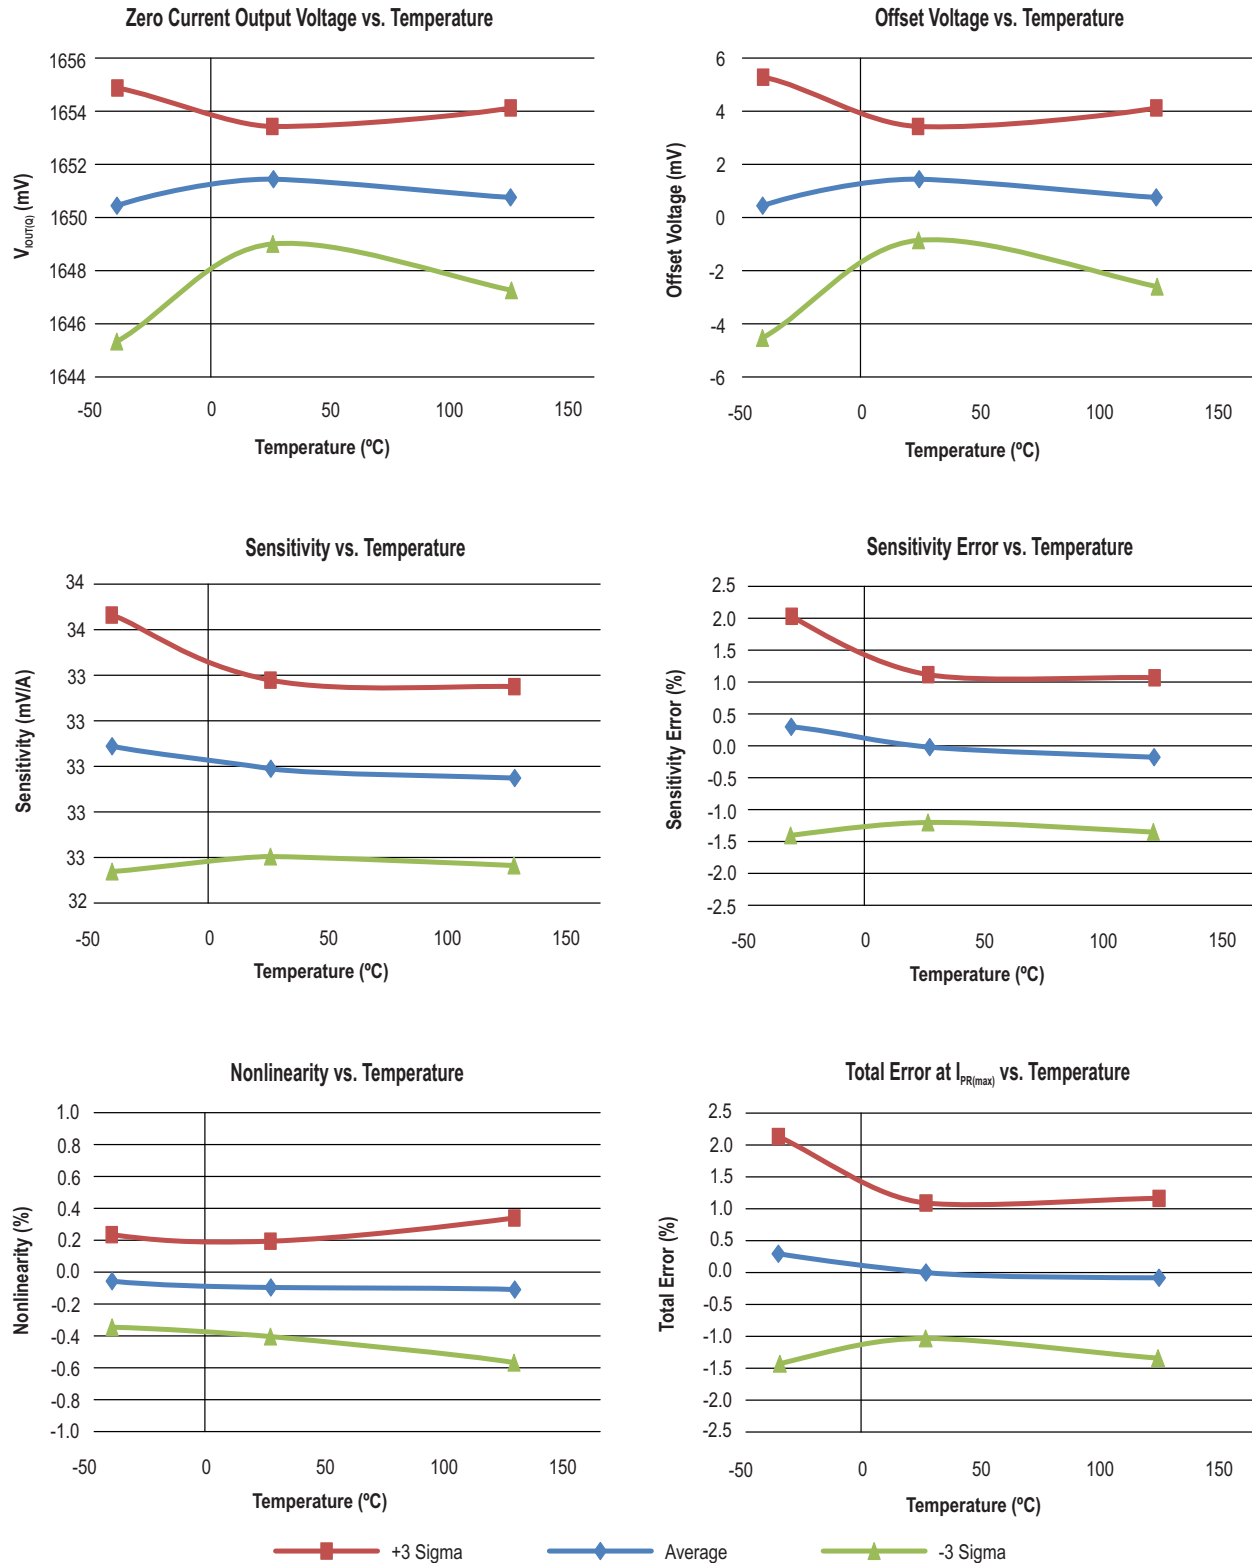

—■— +3 Sigma      —◆— Average      —▲— -3 Sigma

### xKMATR-20AB Key Parameters

### xKMATR-40AB Key Parameters

## DEFINITIONS OF ACCURACY CHARACTERISTICS

### Sensitivity (Sens)

The change in sensor IC output in response to a 1 A change through the primary conductor. The sensitivity is the product of the magnetic coupling factor (G/A) (1 G = 0.1 mT) and the linear IC amplifier gain (mV/G). The linear IC amplifier gain is programmed at the factory to optimize the sensitivity (mV/A) for the full-scale current of the device.

### Nonlinearity ( $E_{LIN}$ )

The nonlinearity is a measure of how linear the output of the sensor IC is over the full current measurement range. The nonlinearity is calculated as:

$$E_{LIN} = \left\{ 1 - \left[ \frac{V_{IOUT}(I_{PR(max)}) - V_{IOUT(Q)}}{2 \times V_{IOUT}(I_{PR(max)/2}) - V_{IOUT(Q)}} \right] \right\} \times 100 (\%)$$

where  $V_{IOUT}(I_{PR(max)})$  is the output of the sensor IC with the maximum measurement current flowing through it and  $V_{IOUT}(I_{PR(max)/2})$  is the output of the sensor IC with half of the maximum measurement current flowing through it.

### Zero Current Output Voltage ( $V_{IOUT(Q)}$ )

The output of the sensor when the primary current is zero. For a unipolar supply voltage, it nominally remains at  $0.5 \times V_{CC}$  for a bidirectional device and  $0.1 \times V_{CC}$  for a unidirectional device. For example, in the case of a bidirectional output device,  $V_{CC} = 3.3$  V translates into  $V_{IOUT(Q)} = 1.65$  V. Variation in  $V_{IOUT(Q)}$  can be attributed to the resolution of the Allegro linear IC quiescent voltage trim and thermal drift.

### Offset Voltage ( $V_{OE}$ )

The deviation of the device output from its ideal quiescent value of  $0.5 \times V_{CC}$  (bidirectional) or  $0.1 \times V_{CC}$  (unidirectional) due to nonmagnetic causes. To convert this voltage to amperes, divide by the device sensitivity, Sens.

### Total Output Error ( $E_{TOT}$ )

The difference between the current measurement from the sensor IC and the actual current ( $I_P$ ), relative to the actual current. This is equivalent to the difference between the ideal output voltage and the actual output voltage, divided by the ideal sensitivity, relative to the current flowing through the primary conduction path:

$$E_{TOT}(I_P) = \frac{V_{IOUT\_ideal}(I_P) - V_{IOUT}(I_P)}{Sens_{ideal}(I_P) \times I_P} \times 100 (\%)$$

The Total Output Error incorporates all sources of error and is a function of  $I_P$ . At relatively high currents,  $E_{TOT}$  will be mostly

due to sensitivity error, and at relatively low currents,  $E_{TOT}$  will be mostly due to Offset Voltage ( $V_{OE}$ ). In fact, at  $I_P = 0$ ,  $E_{TOT}$  approaches infinity due to the offset. This is illustrated in Figures 1 and 2. Figure 1 shows a distribution of output voltages versus  $I_P$  at 25°C and across temperature. Figure 2 shows the corresponding  $E_{TOT}$  versus  $I_P$ .

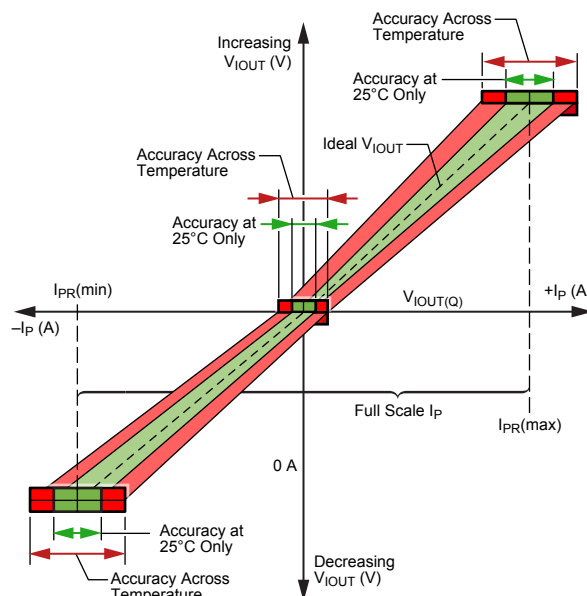

Figure 1: Output Voltage versus Sensed Current

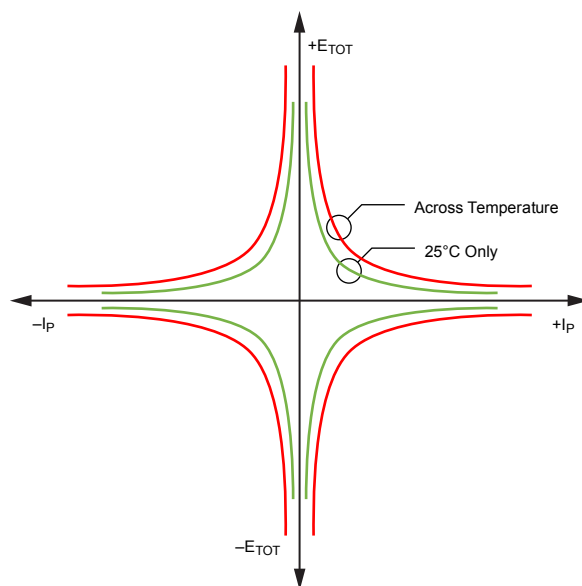

Figure 2: Total Output Error versus Sensed Current

### APPLICATION INFORMATION

#### Impact of External Magnetic Fields

The ACS722 works by sensing the magnetic field created by the current flowing through the package. However, the sensor cannot differentiate between fields created by the current flow and external magnetic fields. This means that external magnetic fields can cause errors in the output of the sensor. Magnetic fields which are perpendicular to the surface of the package affect the output of the sensor, as it only senses fields in that one plane. The error in Amperes can be quantified as:

$$\text{Error}(B) = \frac{B}{C_F}$$

where B is the strength of the external field perpendicular to the surface of the package in Gauss, and  $C_F$  is the coupling factor in G/A. Then, multiplying by the sensitivity of the part (Sens) gives the error in mV.

For example, an external field of 1 Gauss will result in around 0.22 A of error. If the ACS722KMATR-10AB, which has a nominal sensitivity of 132 mV/A, is being used, that equates to 29 mV of error on the output of the sensor.

**Table 1: External Magnetic Field (Gauss) Impact**

External Field (Gauss)	Error (A)	Error (mV)		
		10AB	20AB	40AB
0.5	0.11	15	7	4
1	0.22	29	15	7
2	0.44	58	29	15

#### Estimating Total Error vs. Sensed Current

The Performance Characteristics tables give distribution ( $\pm 3$  sigma) values for Total Error at  $I_{PR(max)}$ ; however, one often wants to know what error to expect at a particular current. This can be estimated by using the distribution data for the components of Total Error, Sensitivity Error and Offset Voltage. The

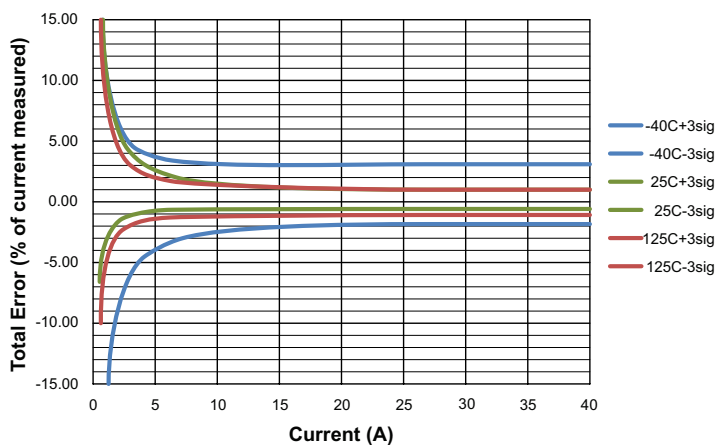

$\pm 3$  sigma value for Total Error ( $E_{TOT}$ ) as a function of the sensed current ( $I_P$ ) is estimated as:

$$E_{TOT}(I_P) = \sqrt{E_{SENS}^2 + \left(\frac{100 \times V_{OE}}{Sens \times I_P}\right)^2}$$

Here,  $E_{SENS}$  and  $V_{OE}$  are the  $\pm 3$  sigma values for those error terms. If there is an average sensitivity error or average offset voltage, then the average Total Error is estimated as:

$$E_{TOT_{AVG}}(I_P) = E_{SENS_{AVG}} + \frac{100 \times V_{OE_{AVG}}}{Sens \times I_P}$$

The resulting total error will be a sum of  $E_{TOT}$  and  $E_{TOT_{AVG}}$ . Using these equations and the 3 sigma distributions for Sensitivity Error and Offset Voltage, the Total Error vs. sensed current ( $I_P$ ) is below for the ACS722KMATR-40AB. As expected, as one goes towards zero current, the error in percent goes towards infinity due to division by zero (refer to Figure 3)

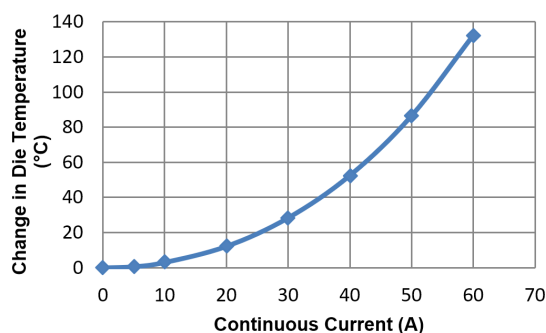

**Figure 3: Predicted Total Error as a Function of Sensed Current for the ACS722KMATR-40AB**

### Thermal Rise vs. Primary Current

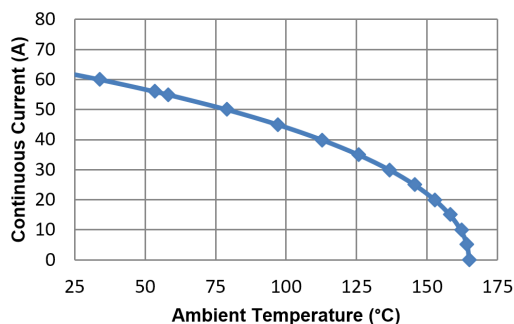

Self-heating due to the flow of current should be considered during the design of any current sensing system. The sensor, printed circuit board (PCB), and contacts to the PCB will generate heat as current moves through the system.

The thermal response is highly dependent on PCB layout, copper thickness, cooling techniques, and the profile of the injected current. The current profile includes peak current, current “on-time”, and duty cycle. While the data presented in this section was collected with direct current (DC), these numbers may be used to approximate thermal response for both AC signals and current pulses.

The plot in Figure 4 shows the measured rise in steady-state die temperature of the ACS722 versus continuous current at an ambient temperature,  $T_A$ , of 25 °C. The thermal offset curves may be directly applied to other values of  $T_A$ . Conversely, Figure 5 shows the maximum continuous current at a given  $T_A$ . Surges beyond the maximum current listed in Figure 5 are allowed given the maximum junction temperature,  $T_{J(MAX)}$  (165°C), is not exceeded.

**Figure 4: Self-Heating in the MA Package Due to Current Flow**

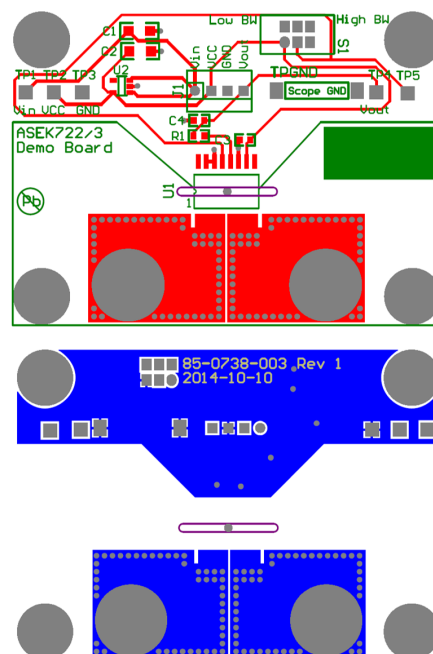

**Figure 5: Maximum Continuous Current at a Given  $T_A$**

The thermal capacity of the ACS722 should be verified by the end user in the application's specific conditions. The maximum junction temperature,  $T_{J(MAX)}$  (165°C), should not be exceeded. Further information on this application testing is available in the [DC and Transient Current Capability application note](#) on the Allegro website.

### ASEK722 Evaluation Board Layout

Thermal data shown in Figure 4 and Figure 5 was collected using the ASEK722 Evaluation Board (TED-85-0738-003). This board includes 1280 mm<sup>2</sup> of 4 oz. copper (0.1388) connected to pins 1 through 4, and to pins 5 through 8, with thermal vias connecting the layers. Top and Bottom layers of the PCB are shown below in Figure 6.

**Figure 6: Top and Bottom Layers for ASEK722 Evaluation Board**

Gerber files for the ASEK722 evaluation board are available for download from the Allegro website. See the technical documents section of the [ACS722 device webpage](#).

### DEFINITIONS OF DYNAMIC RESPONSE CHARACTERISTICS

#### Power-On Time ( $t_{PO}$ )

When the supply is ramped to its operating voltage, the device requires a finite time to power its internal components before responding to an input magnetic field.

Power-On Time ( $t_{PO}$ ) is defined as the time it takes for the output voltage to settle within  $\pm 10\%$  of its steady state value under an applied magnetic field, after the power supply has reached its minimum specified operating voltage ( $V_{CC(min)}$ ) as shown in the chart at right (refer to Figure 7).

#### Rise Time ( $t_r$ )

The time interval between: a) when the sensor IC reaches 10% of its full scale value; and b) when it reaches 90% of its full scale value (refer to Figure 8). The rise time to a step response is used to derive the bandwidth of the current sensor IC, in which  $f(-3 \text{ dB}) = 0.35/t_r$ . Both  $t_r$  and  $t_{RESPONSE}$  are detrimentally affected by eddy current losses observed in the conductive IC ground plane.

#### Propagation Delay ( $t_{pd}$ )

The propagation delay is measured as the time interval between: a) when the primary current signal reaches 20% of its final value; and b) when the device reaches 20% of its output corresponding to the applied current (refer to Figure 8).

#### Response Time ( $t_{RESPONSE}$ )

The time interval between: a) when the primary current signal reaches 90% of its final value; and b) when the device reaches 90% of its output corresponding to the applied current (refer to Figure 9).
