

Pin Descriptions

Pin Number	Pin Name	Function
1	VIN	Supply input pin. A capacitor should be connected between the VIN pin and GND pin to keep the DC input voltage constant.
2	OUT	Gate driver pin. This pin is connected to external MOSFET gate to turn it on/off.
3	GND	Ground pin
4	CS	Over current protection pin
5	FB	Feedback pin. This pin is connected to an external resistor divider to program the system output voltage.
6	COMP	Compensation pin. This pin is the output of the internal error amplifier. COMP is forced to low when $V_{IN} < 3.6V$.
7	OVP	Overvoltage detection pin
8	EN	Enable and dimming pin. When EN input voltage is lower than 0.3V, disable the IC. When EN input voltage is higher than 2.6V, enable the IC. PWM dimming can be provided by an external control signal greater than 100Hz, duty cycle from 1% to 90%. In addition, analog dimming can be provided by a DC signal ranged from 0.8 V to 2.4V.

Functional Block Diagram

Absolute Maximum Ratings (Note 4)

Symbol	Parameter	Rating	Unit
V_{IN}	Input Voltage	-0.3 to 20	V
V_{EN}	EN Pin Voltage	-0.3 to $V_{IN} + 0.3$	V
V_{GATE}	OUT Pin Voltage	20	V
V_{OVP}	OVP Pin Voltage	7	V
V_{FB}	FB Pin Voltage	-0.3 to +5.5	V
T_J	Operating Junction Temperature	+150	°C
T_{STG}	Storage Temperature Range	-65 to +150	°C
T_{LEAD}	Lead Temperature (Soldering, 10sec)	+260	°C
θ_{JA}	Thermal Resistance (Junction to Ambient)	105	°C/W
–	ESD (Machine Model)	600	V
–	ESD (Human Body Model)	4000	V

Note 4. Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “Recommended Operating Conditions” is not implied. Exposure to “Absolute Maximum Ratings” for extended periods may affect device reliability.

Recommended Operating Conditions

Symbol	Parameter	Min	Max	Unit
V_{IN}	Input Voltage	4	18	V
T_A	Operating Ambient Temperature	-40	+85	°C

Electrical Characteristics (@ $V_{IN} = 5V$, $T_A = +25^\circ C$, unless otherwise specified.)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
SUPPLY VOLTAGE (VIN PIN)						
V _{IN}	Input Voltage	–	4.0	–	18	V
I _Q	Quiescent Current	Test at V _{FB} = 0.3V	–	5	–	mA
I _{SHDN}	Shutdown Supply Current	V _{EN} = 0V	–	0.1	–	µA
UNDER VOLTAGE LOCKOUT						
V _{UVLO}	Input UVLO Threshold	V _{IN} Rising	3.6	3.8	4.0	V
V _{HYS}	Input UVLO Hysteresis	–	100	200	300	mV
OVER VOLTAGE PROTECTION						
–	Over Voltage Threshold	–	1.45	1.55	1.65	V
–	Under Voltage Threshold	–	–	0.1	–	V
OVER CURRENT PROTECTION

Application Information

General Operation

The AL3022 uses a constant frequency, voltage mode control scheme to provide excellent line and load regulation. To drive LED load, the AL3022 can be connected as shown in the Typical Applications Circuit on page 1. The maximum duty cycle of the PWM controller is limited to 90%. PWM dimming input can be provided by an external control signal greater than 100Hz, duty ratio of 1% to 90%. In addition, analog dimming can be provided by a DC signal ranged from 0.8V to 2.4V.

The AL3022 offers comprehensive protection features such as UVLO, OCP, OVP, OTP, LED open and V_{OUT} Short to GND.

Enable/Dimming Control

The AL3022 uses EN pin to turn on and off the controller and also perform Digital (PWM) Dimming.

When EN input voltage is lower than 0.3V, the controller turns off and the shutdown current can be limited below 0.1 μ A. When EN input voltage is higher than 2.6V, the controller turns on and the reference voltage is set to 0.2V.

The AL3022 has an internal $80 \pm 15\%$ k Ω pull low resistor on the EN pin, thus the device is normally in the off state or shutdown mode operation.

When a PWM signal was presented into the EN pin of the AL3022 shown in Figure 1 below.

- 1). When the EN pin is higher than 2.6V, the device will turn on and the output current is at the programmed maximum level.
- 2). When the EN pin is lower than 0.3V, the device will turn off and the output current goes to 0mA.

If the frequency of the PWM signal is greater than 100Hz, the human eye cannot detect the on and off state of the LEDs. The human eye can only see a dimmed diode rather than a pulsed brightness. This dimming method provides a controlled inrush current at turn-on. The PWM duty cycle from 0% to 100% controls the output current from 0mA to the maximum programmed level.

Figure 1. Digital Dimming Control Using a PWM Signal in EN Pin

Analog Dimming Control

The Analog Dimming is to inject a constant DC voltage to EN pin shown in Figure 2 below. The feedback voltage is indirectly adjusted when the EN pin voltage is from 0.8V to 2.4V, which can be used as dimming control. The output LED current can be adjusted from minimum to maximum level by applying the DC voltage level from 0.8V to 2.4V.

Comparing with all kinds of dimming control, this method features a best output voltage and LEDs current.

Application Information (cont.)

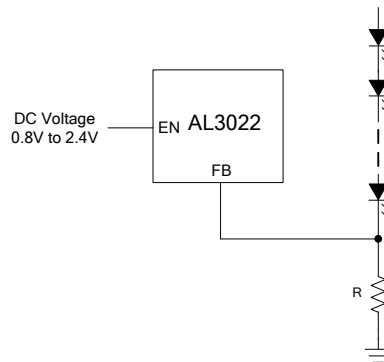

Figure 2. Analog Dimming Control Using a DC Voltage Signal in EN Pin

Soft Start Control

The AL3022 external compensation circuit can clamp the output waveform to soft start smoothly.

Operation Protection

1. Under Voltage Lockout

The AL3022 provides an under voltage lockout circuit to prevent it from undefined status when startup. The Under Voltage Lockout circuit turns the driver off when supplying voltage drops below 3.6V. The UVLO circuit has 200mV hysteresis, which means the device starts up again when V_{IN} rises to 3.8V.

2. Over Voltage Protection / LED Open Protection

The controller has an internal OVP circuit. The controller output voltage will boost too high when LEDs are disconnected from the circuit or fail to open. The AL3022 will latch off the output if the OVP pin senses a voltage that is larger than 1.55V, and the power switching will be turned off. The latched off status can be reset by reducing the supply voltage to lower than 3.6V or EN lower than 0.3V.

3. Under Voltage Protection / V_{OUT} Short to GND Protection

The AL3022 monitors the OVP pin, if the OVP pin voltage is less than 0.1V, MOSFET drive output will turn off. When OVP is higher than 0.1V, system can auto recover. This protects the converter if V_{OUT} is shorted to ground.

4. Over Current Protection

The AL3022 integrates an OCP circuit. The CS pin is connected to the voltage-sensor (RCS) that placed between the Drain of MOS and GND. If the voltage on CS pin exceeds 0.33V, it is turned off immediately and will not turn on until the next cycle begins.

5. Over Temperature Protection

The AL3022 monitors the temperature of itself. The AL3022 shuts itself off if the temperature exceeds the threshold value (typically +160°C). This is a no-latched protection. The device recovers once the temperature has decreased approximately +20°C.

Ordering Information

Package	Temperature Range	Part Number	Marking ID	Packing
SO-8	-40°C to +85°C	AL3022MTR-G1	L3022M-G1	3000/13" Tape & Reel

Marking Information

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
