Figure 1-1. Pin Configurations

Pin	Function
A ₀ – A ₂	Address Inputs
GND	Ground
SDA	Serial Data
SCL	Serial Clock Input
WP	Write Protect
V _{CC}	Power Supply

Note: Drawings are not to scale.

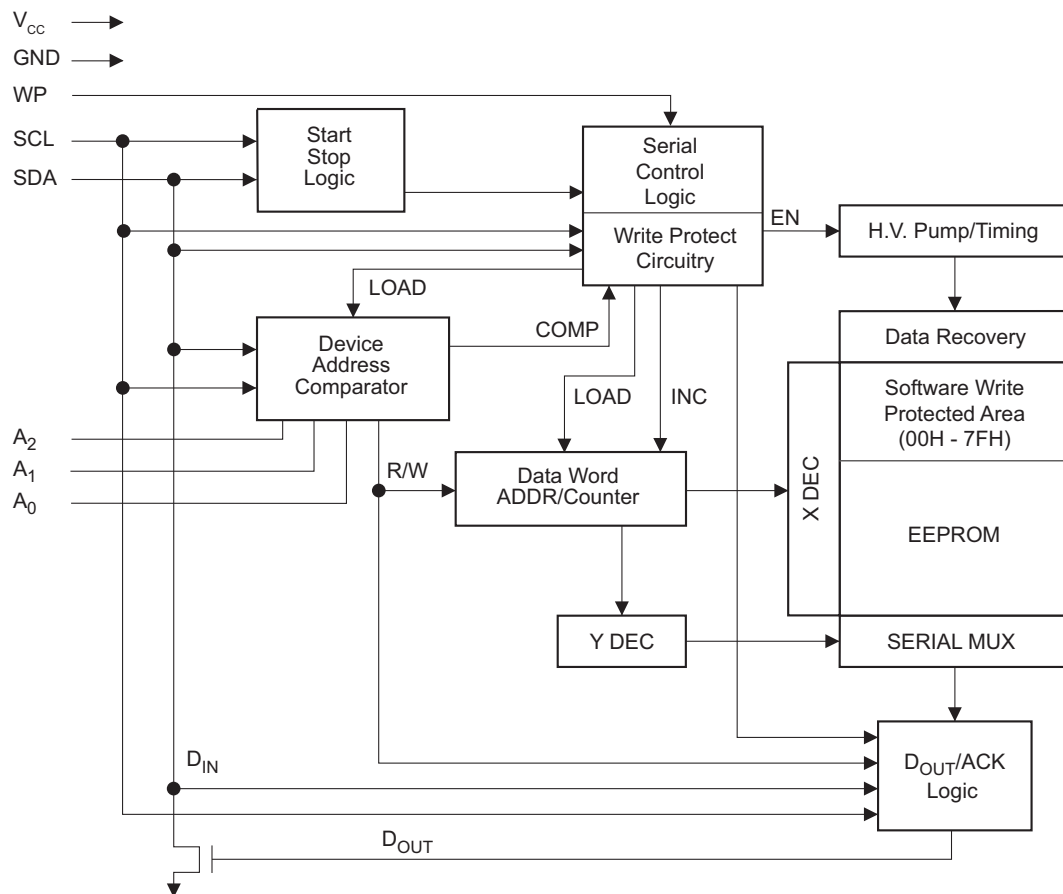

2. Memory Organization

2.1 AT34C02D, 2K Serial EEPROM:

The AT34C02D is internally organized with 16 pages of 16 bytes of EEPROM each. Random word addressing requires a 8-bit data word address.

3. Block Diagram

Figure 3-1. Block Diagram

4. Pin Description

Serial Clock (SCL): The SCL input is used to positive edge clock data into each EEPROM device and negative edge clock data out of each device.

Serial Data (SDA): The SDA pin is bidirectional for serial data transfer. This pin is open-drain driven and may be wire-ORed with any number of other open-drain or open collector devices.

Device Addresses (A_2 , A_1 , and A_0): The A_2 , A_1 , and A_0 pins are device address inputs that are hardwired (directly to GND or to Vcc) for compatibility with other Atmel AT24Cxx devices. When the pins are hardwired, as many as eight 2K devices may be addressed on a single bus system. See [Section 7. “Device Addressing” on page 9](#) for more details. A device is selected when a corresponding hardware and software match is true. If these pins are left floating, the A_2 , A_1 , and A_0 pins will be internally pulled down to GND. However, due to capacitive coupling that may appear during customer applications, Atmel recommends always connecting the address pins to a known state. When using a pull-up resistor, Atmel recommends using 10k Ω or less.

Write Protect (WP): The write protect input, when connected to GND, allows normal write operations. When WP is connected directly to V_{CC}, all write operations to the memory are inhibited. If the pin is left floating, the WP pin will be internally pulled down to GND. However, due to capacitive coupling that may appear during customer applications, Atmel recommends always connecting the WP pins to a known state. When using a pull-up resistor, Atmel recommends using 10k Ω or less.

Table 4-1. AT34C02D Write Protection Modes

WP Pin Status	Permanent Write Protect Register	Reversible Write Protect Register	Part of the Array Write Protected
V _{CC}	—	—	Full Array (00h – FFh)
GND or Floating	Programmed	—	Lower-half of Array (00h – 7Fh)
GND or Floating	—	Programmed	Lower-half of Array (00h – 7Fh)
GND or Floating	Not Programmed	Not Programmed	None, Normal Read/Write

5. Electrical Characteristics

5.1 Absolute Maximum Ratings*

Operating Temperature	-55°C to +125°C
Storage Temperature	-65°C to +150°C
Voltage on any pin with respect to ground	-1.0V to +7.0V
Maximum Operating Voltage	6.25V
DC Output Current	5.0mA

*Notice: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

5.2 Pin Capacitance

Applicable over recommended operating range from $T_A = 25^\circ\text{C}$, $f = 400\text{kHz}$, $V_{CC} = 1.7\text{V}$ to 5.5V .

Symbol	Test Condition	Max	Units	Conditions
$C_{I/O}^{(1)}$	Input/Output Capacitance (SDA)	8	pF	$V_{I/O} = 0\text{V}$
$C_{IN}^{(1)}$	Input Capacitance (A_0 , A_1 , A_2 , SCL)	6	pF	$V_{IN} = 0\text{V}$

Note: 1. This parameter is characterized and is not 100% tested.

5.3 DC Characteristics

Applicable over recommended operating range from: $T_{AI} = -40^\circ\text{C}$ to $+85^\circ\text{C}$, $V_{CC} = 1.7\text{V}$ to 5.5V , (unless otherwise noted).

Symbol	Parameter	Test Condition	Min	Typ	Max	Units
V_{CC}	Supply Voltage		1.7		5.5	V
I_{CC1}	Supply Current $V_{CC} = 5.0\text{V}$	Read at 400kHz		1.0	2.0	mA
I_{CC2}	Supply Current $V_{CC} = 5.0\text{V}$	Write at 400kHz		2.0	3.0	mA
I_{SB1}	Standby Current $V_{CC} = 1.7\text{V}$	$V_{IN} = V_{CC}$ or V_{SS}			1.0	μA
I_{SB2}	Standby Current $V_{CC} = 3.6\text{V}$	$V_{IN} = V_{CC}$ or V_{SS}			3.0	μA
I_{SB3}	Standby Current $V_{CC} = 5.5\text{V}$	$V_{IN} = V_{CC}$ or V_{SS} , $A_0 = V_{SS}$			6.0	μA
I_{LI}	Input Leakage Current	$V_{IN} = V_{CC}$ or V_{SS}		0.10	3.0	μA
I_{LO}	Output Leakage Current	$V_{OUT} = V_{CC}$ or V_{SS}		0.05	3.0	μA
V_{IL}	Input Low Level ⁽¹⁾		-0.6		$V_{CC} \times 0.3$	V
V_{IH}	Input High Level ⁽¹⁾		$V_{CC} \times 0.7$		$V_{CC} + 0.5$	V
V_{OL2}	Output Low Level $V_{CC} = 3.0\text{V}$	$I_{OL} = 2.1\text{mA}$			0.4	V
V_{OL1}	Output Low Level $V_{CC} = 1.7\text{V}$	$I_{OL} = 0.15\text{mA}$			0.2	V

Note: 1. V_{IL} min and V_{IH} max are reference only and are not tested.

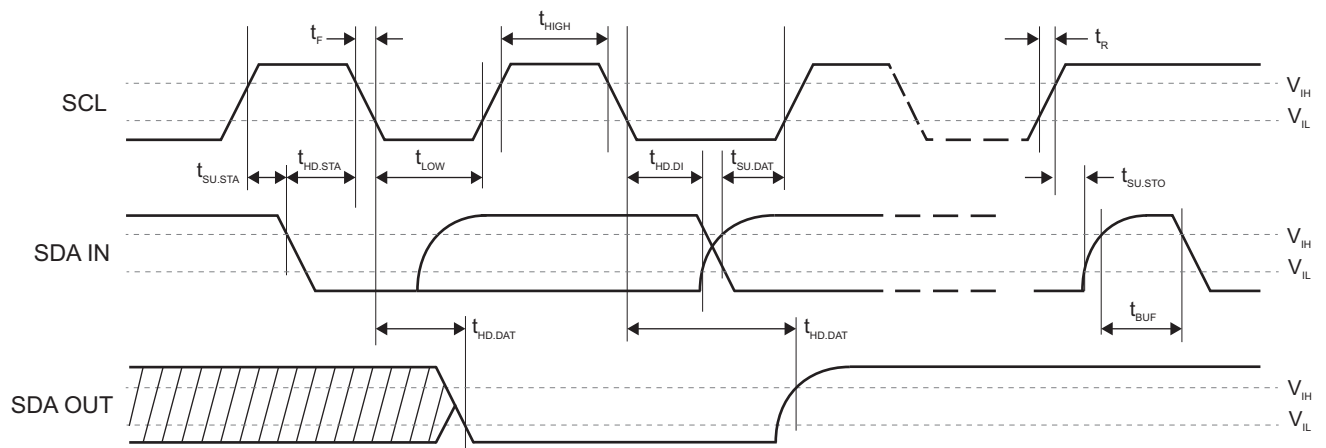

5.4 AC Characteristics

Applicable over recommended operating range from: $T_{AI} = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$ (unless otherwise noted).

Symbol	Parameter	$V_{CC} = 1.7$ to 3.6V		$V_{CC} = 1.7$ to 3.6V		$V_{CC} = 3.6\text{V}$ to 5.5V		Units
		Min	Max	Min	Max	Min	Max	
f_{SCL}	Clock Frequency, SCL		100		400		1000	kHz
t_{LOW}	Clock Pulse Width Low	4,700	—	1,300	—	400	—	ns
t_{HIGH}	Clock Pulse Width High	4,000	—	600	—	400	—	ns
t_R	Inputs Rise Time ⁽¹⁾	—	1000	—	300	—	100	ns
t_F	Inputs Fall Time ⁽¹⁾	—	300	—	300	—	100	ns
$t_{SU,DAT}$	Data in Set-up Time	250	—	100	—	100	—	ns
$t_{HD,DI}$	Data in Hold Time	0	—	0	—	0	—	ns
$t_{HD,DAT}$	Data Out Hold Time	200	3,450	200	900	50	550	ns
$t_{SU,STA}$	Start Condition Set-up Time	4,700	—	600	—	250	—	ns
$t_{HD,STA}$	Start Condition Hold Time	4,000	—	600	—	250	—	ns
$t_{SU,STO}$	Stop Condition Set-up Time	4,000	—	600	—	250	—	ns
t_i	Pulse Width of Spikes Suppressed, Single Glitch ⁽¹⁾	—	100	—	100	—	50	ns
t_{BUF}	Time the bus must be free before a new transmission can start ⁽¹⁾	4,700	—	1,300	—	50	—	ns
t_{WR}	Write Cycle Time	—	5	—	5	—	5	ms
Endurance ⁽¹⁾	25°C, Page Mode, 3.3V	1M	—	1M	—	1M	—	Write Cycles

Note: 1. This parameter is characterized and is not 100% tested.

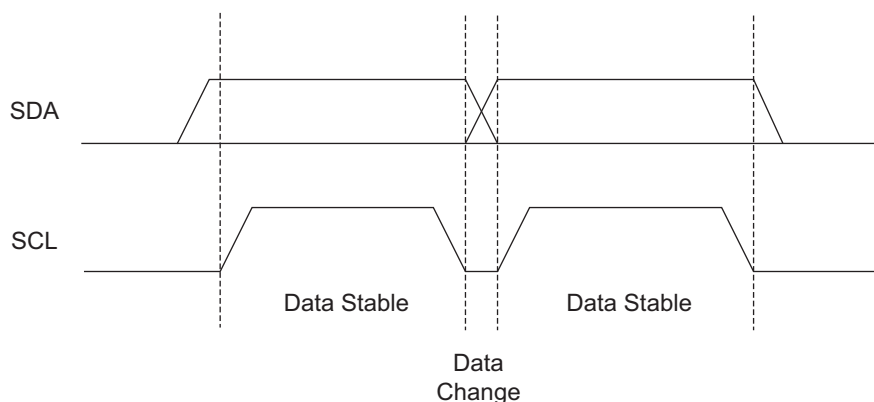

Figure 5-1. AC Timing Waveforms

6. Device Operation

Clock and Data Transitions: The SDA pin is normally pulled high with an external device. Data on the SDA pin may change only during SCL low time periods. Data changes during SCL high periods will indicate a Start or Stop condition as defined below.

Figure 6-1. Data Validity

Start Condition: A high-to-low transition of SDA with SCL high is a Start condition which must precede any other command.

Stop Condition: A low-to-high transition of SDA with SCL high is a Stop condition. After a read sequence, the Stop command will place the EEPROM in a standby power mode.

Figure 6-2. Start and Stop Condition

Acknowledge: All addresses and data words are serially transmitted to and from the EEPROM in 8-bit words. The EEPROM sends a zero to acknowledge that it has received each word. This happens during the ninth clock cycle.

Figure 6-3. Output Acknowledge

Standby Mode: The AT34C02D features a low-power standby mode which is enabled:

- Upon power-up or
- After the receipt of the Stop condition and the completion of any internal operations.

6.1 Memory Reset:

After an interruption in protocol, power loss or system reset, any 2-wire part can be reset by following these steps:

1. Create a Start condition.
2. Clock nine cycles.
3. Create another Start condition followed by Stop condition as shown below.

Figure 6-4. Software Reset

7. Device Addressing

The 2K EEPROM device requires an 8-bit device address word following a start condition to enable the chip for a read or write operation.

The device address word consists of a mandatory '1010' (Ah) sequence for the first four most-significant bits for normal read and write operations and '0110' (6h) for writing to the software write protect register.

The next three bits are the A_2 , A_1 , and A_0 device address bits. These three bits must match their corresponding hard-wired input pins in order for the part to acknowledge.

The eighth bit of the device address is the read/write operation select bit. A read operation is initiated if this bit is high and a write operation is initiated if this bit is low.

Upon a successful compare of the device address, the EEPROM will acknowledge by outputting a zero. If a match is not made, the chip will return to a standby state. The device will not acknowledge if the write protect register has been programmed and the control code is '0110' (6h).

Figure 7-1. Device Address

8. Write Operations

Byte Write: A write operation requires an 8-bit data word address following the device address word and acknowledgment. Upon receipt of this address, the EEPROM will again acknowledge or respond with a zero and then clock in the first 8-bit data word. Following receipt of the 8-bit data word, the EEPROM will output a zero and the addressing device, such as a microcontroller, must terminate the write sequence with a stop condition. At this time the EEPROM enters an internally-timed write cycle, t_{WR} , to the nonvolatile memory. All inputs are disabled during this write cycle and the EEPROM will not respond until the write is complete.

The device will acknowledge a write command, but not write the data, if the software or hardware write protection has been enabled. The write cycle time must be observed even when the write protection is enabled.

Figure 8-1. Byte Write

Page Write: The 2K device is capable of 16-byte page write.

A page write is initiated the same as a byte write, but the microcontroller does not send a stop condition after the first data word is clocked in. Instead, after the EEPROM acknowledges receipt of the first data word, the microcontroller can transmit up to fifteen more data words. The EEPROM will respond with a zero after each data word received. The microcontroller must terminate the page write sequence with a stop condition.

The data word address lower four bits are internally incremented following the receipt of each data word. The higher data word address bits are not incremented, retaining the memory page row location. When the word address, internally generated, reaches the page boundary, the following data byte is placed at the beginning of the same page. If more than sixteen data words are transmitted to the EEPROM, the data word address will “roll over” and previous data will be overwritten. The address “roll over” during write is from the last byte of the current page to the first byte of the same page.

The device will acknowledge a write command, but not write the data, if the software or hardware write protection has been enabled. The write cycle time must be observed even when the write protection is enabled.

Figure 8-2. Page Write

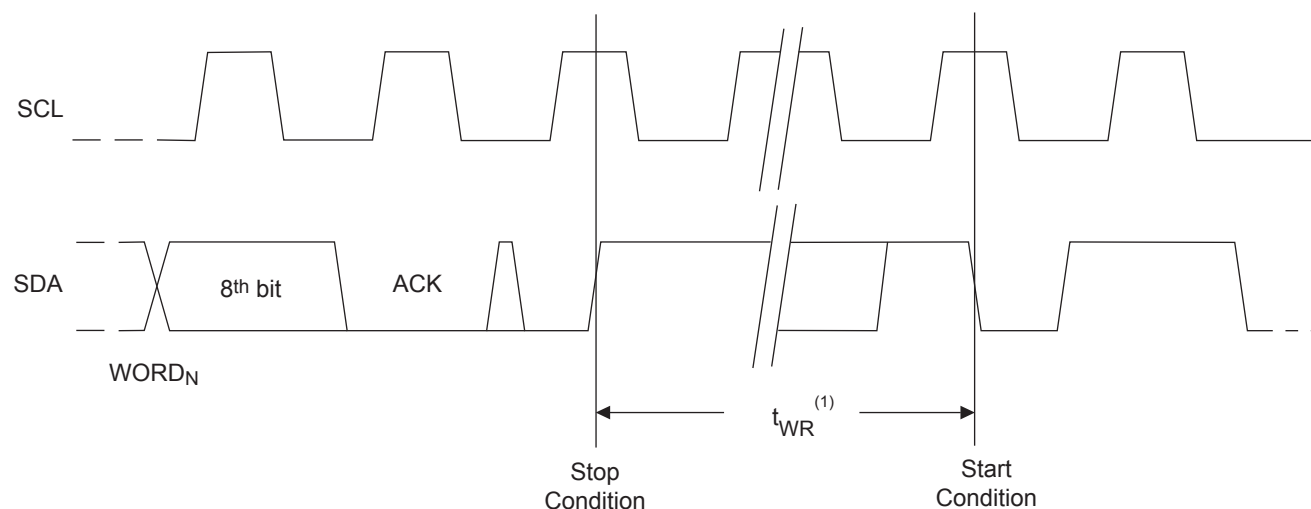

Figure 8-3. Write Cycle Timing

Note: 1. The write cycle time t_{WR} is the time from a valid Stop condition of a write sequence to the end of the internal clear/write cycle.

Acknowledge Polling: Once the internally-timed write cycle has started and the EEPROM inputs are disabled, acknowledge polling can be initiated. This involves sending a start condition followed by the device address word. The read/write bit is representative of the operation desired. Only if the internal write cycle has completed will the EEPROM respond with a zero allowing the read or write sequence to continue.

8.1 Write Protection

The software write protection, once enabled, write protects only the lower-half of the array (addresses 0x00 – 0x7F) while the hardware write protection, via the WP pin, is used to protect the entire array.

Permanent Software Write Protection: The permanent software write protection is enabled by sending a command to the device, similar to a normal write command, which programs the permanent write protect register. This must be done with the WP pin low. The write protect register is programmed by sending a write command with the device address of '0110' (6h) instead of '1010' (Ah) with the address and data bit(s) being don't cares. Once the permanent software write protection has been enabled, the device will no longer acknowledge the '0110' (6h) control byte. The permanent software write protection cannot be reversed even if the device is powered down. The write cycle time must be observed.

Figure 8-4. Setting Permanent Write Protect Register (PSWP)

Reversible Software Write Protection: The reversible software write protection is enabled by sending a command to the device, similar to a normal write command, which programs the reversible write protect register. This must be done with the WP pin low. The reversible write protect register is programmed by sending a write command '01100010' (62h) with pins A₂ and A₁ tied to ground and pin A₀ connected to V_{HV} (see Figure 8-5). The reversible write protection can be reversed by sending a command '01100110' (66h) with pin A₂ tied to ground, pin A₁ tied to V_{CC} and pin A₀ tied to V_{HV} (see Figure 8-6).

Figure 8-5. Setting Reversible Write Protect Register (RSWP)

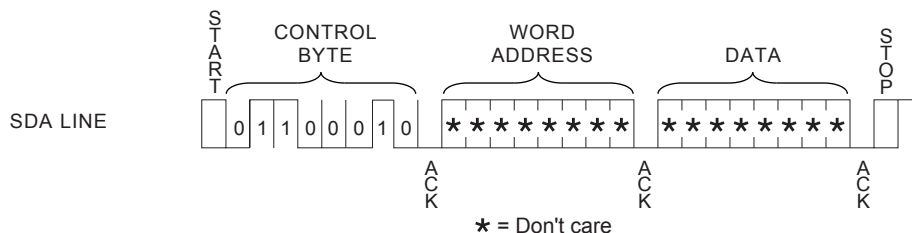

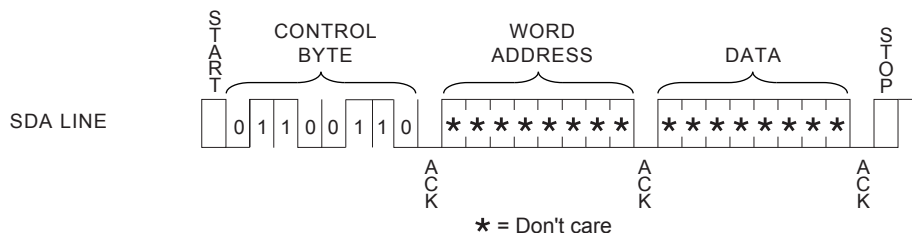

Figure 8-6. Clearing Reversible Write Protect Register (RSWP)

Hardware Write Protection: The WP pin can be connected to V_{CC} , GND, or left floating. Connecting the WP pin to V_{CC} will write protect the entire array, regardless of whether or not the software write protection has been enabled or invoked. The software write protection register cannot be programmed when the WP pin is connected to V_{CC} . If the WP pin is connected to GND or left floating, the write protection mode is determined by the status of the software write protect register.

Table 8-1. Write Protection

Command	Pin State/Voltage			Preamble							R/W
	A_2	A_1	A_0	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Set RSWP	Write	Not Programmed	Programmed	No ACK	No ACK	STOP — Indicates reversible write protect register is programmed.
Set RSWP	Write	Not Programmed	Not Programmed	ACK	No ACK	Cannot program write protect registers.
Set RSWP	Write	Programmed	X	No ACK	No ACK	STOP — Indicates permanent write protect register is programmed.
Clear RSWP	Write	Programmed	X	No ACK	No ACK	STOP — Indicates permanent write protect register is programmed.
Clear RSWP	Write	Not Programmed	X	ACK	No ACK	Cannot write to write protect registers.

9. Read Operations

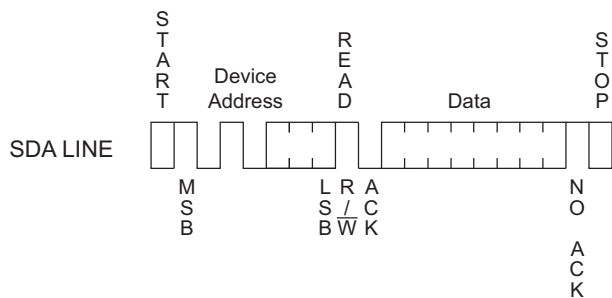

Read operations are initiated the same way as write operations with the exception that the read/write select bit in the device address word is set to one. There are three read operations:

- Current Address Read
- Random Address Read
- Sequential Read

Current Address Read: The internal data word address counter maintains the last address accessed during the last read or write operation, incremented by one. This address stays valid between operations as long as the chip power is maintained. The address “roll over” during read is from the last byte of the last memory page to the first byte of the first page.

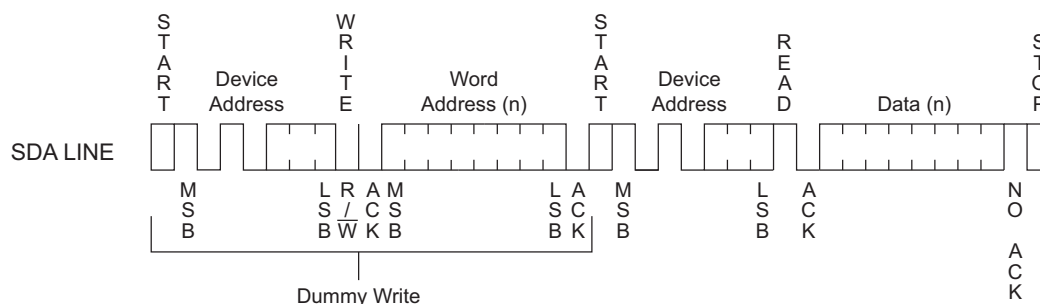

Once the device address with the read/write select bit set to one is clocked in and acknowledged by the EEPROM, the current address data word is serially clocked out. To end the command, the microcontroller does not respond with a zero but does generate a stop condition in the subsequent clock cycle.

Figure 9-1. Current Address Read

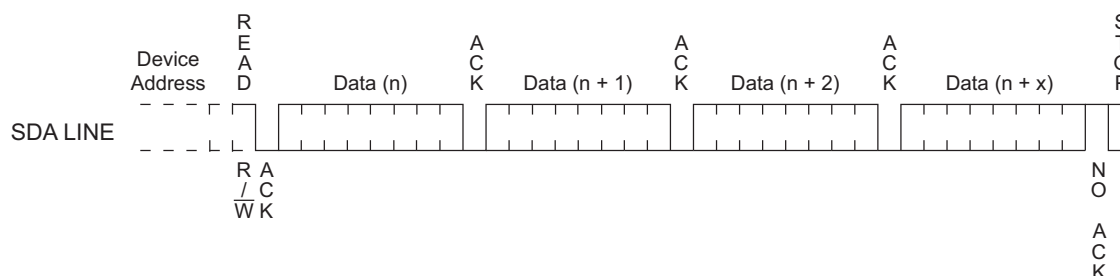

Random Read: A random read requires a “dummy” byte write sequence to load in the data word address. Once the device address word and data word address are clocked in and acknowledged by the EEPROM, the microcontroller must generate another start condition. The microcontroller now initiates a current address read by sending a device address with the read/write select bit high. The EEPROM acknowledges the device address and serially clocks out the data word. To end the command, the microcontroller does not respond with a zero but does generate a stop condition in the subsequent clock cycle.

Figure 9-2. Random Read

Sequential Read: Sequential Reads are initiated by either a current address read or a random address read. After the microcontroller receives a data word, it responds with an acknowledge. As long as the EEPROM receives an acknowledge, it will continue to increment the data word address and serially clock out sequential data words. When the memory address limit is reached, the data word address will “roll-over” and the sequential read will continue. The sequential read operation is terminated when the microcontroller does not respond with a zero but does generate a stop condition in the subsequent clock cycle.

Figure 9-3. Sequential Read

Permanent Write Protect Register (PSWP) Status: Determining the status of the permanent write protect register can be accomplished by sending a similar command to the device as was used when programming the register, except the R/W bit must now be set to a one. If the device returns an acknowledge, the permanent write protect register has not been programmed. Otherwise, it has been programmed and the lower-half of the array is permanently write protected.

Reversible Write Protect Register (RSWP) Status: Determining the status of the reversible write protect register can be accomplished by sending a similar command to the device as was used when programming the register, except the R/W bit must be set to one. If the device returns an acknowledge, then the reversible write protect register has been programmed. The lower-half of the array is write protected, but remains reversible.

Table 9-1. PSWP and RSWP Status

Command	Pin State/Voltage			Preamble							R/W
	A ₂	A ₁	A ₀	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Read PSWP	A ₂	A ₁	A ₀	0	1	1	0	A ₂	A ₁	A ₀	1
Read RSWP	0	0	A ₀	0	1	1	0	0	0	1	1

14. Revision History

Doc. Rev.	Date	Comments
8781D	01/2015	Added the UDFN extended quantity option. Updated the ordering information section and the 8MA2 package outline drawing.
8781C	07/2014	Updated various language elements for consistency with JEDEC EE1002/1002A. Updated AC timing terminology for consistency with JEDEC EE1002/1002A. Added 100kHz timing information for SPD applications using < 2.2V V _{CC} supply. Miscellaneous formatting changes and text corrections. Update package drawings.
8781B	06/2012	Correct ordering code: - AT34C02D-WWU11, Die Sale to AT34C02D-WWU11M, Wafer Sale. Update template.
8781A	03/2012	Initial document release.

Unless specifically provided otherwise, Atmel products are not suitable for, and shall not be used in, automotive applications. Atmel products are not intended, authorized, or warranted for use as components in applications intended to support or sustain life.

SAFETY-CRITICAL, MILITARY, AND AUTOMOTIVE APPLICATIONS DISCLAIMER: Atmel products are not designed for and will not be used in connection with any applications where the failure of such products would reasonably be expected to result in significant personal injury or death ("Safety-Critical Applications") without an Atmel officer's specific written consent. Safety-Critical Applications include, without limitation, life support devices and systems, equipment or systems for the operation of nuclear facilities and weapons systems. Atmel products are not designed nor intended for use in military or aerospace applications or environments unless specifically designated by Atmel as military-grade. Atmel products are not designed nor intended for use in automotive applications unless specifically designated by Atmel as automotive-grade.
